THE METAL WORKER

VOLUME LVIII.

JULY TO DECEMBER, 1902.

NEW YORK:

DAVID WILLIAMS COMPANY, PUBLISHERS, 232-238 WILLIAM STREET.

1903

THE GREAT WORK

OF THE

TO THE

INDEX TO VOLUME LVIII.

Illustrated Articles Indicated by *.

A.

Abram Cox Stove Company, Nov 29, p 31
 Account books, Removable leaf, Dec 20, p 32
 Acetylene gas:
 Acetylene rendered harmless, Dec 6, p 39
 Car lighting, Aug 30, p 52
 Incandescent and carburated gas, Sep 27, p 72
 Insurance and acetylene, Aug 16, p 37, 45
 Possibilities at the St. Louis Fair, Aug 16, p 51
 Town lighting, Nov 29, p 43
 Acetylene gas burners:
 Columbia, Oct 18, p 44*; Dec 27, p 40*
 Second Wonder, Sep 19, p 48*
 Sunlight, Nov 15, p 50*
 Acetylene gas convention, July 12, p 33; Aug 9, p 53; 16, p 48
 Acetylene generators:
 Drake Series C, July 26, p 49; Aug 23, p 48*
 Drake Special, Nov 15, p 45
 Efficiency of, Aug 2, p 51
 Ideal Epworth "D," Dec 13, p 43*
 Pathfinder portable, Aug 30, p 48*
 Acetylene gas range, Graf, July 5, p 34*
 Acetylene gas plant, Cost of, July 5, p 46
 Acetylene gas supplies, Williamson, Sep 27, p 56
 Acetylene gas wrinkles, Aug 16, p 52
 Advertising:
 Hints, Aug 30, p 43
 "Take a look at this stove," July 26, p 42*
 (See also Business methods: Window display.)
 Aeolipyle Company, Nov 1, p 38
 Aerated fuel process, Aug 2, p 47
 Agate ware as a life saver, Nov 29, p 36
 Agricultural prosperity, Aug 9, p 35; Sep 27, p 43
 Air diffuser, Degge, Aug 16, p 44*
 Air in steam radiators, Liberating, Oct 18, p 45*
 Air valves, Argon automatic, Oct 11, p 50*
 Alcohol motors in Germany, Sep 13, p 53
 Alexander Furnace & Mfg. Company, Business methods, Dec 13, p 30
 Allen automatic air valve, Aug 16, p 50*
 Aluminum:
 Commercially pure, July 26, p 55
 Manufacture of, Nov 1, p 42
 Rules for casting, Sep 13, p 57
 Aluminum nursery saucepan, Dec 20, p 42*
 Aluminum paint, Dec 27, p 35
 Aluminum solder:
 Totten, July 5, p 44
 Webster, Sep 20, p 63
 Whitney, Aug 2, p 58
 Aluminum soldering, Aug 30, p 46; Nov 1, p 55
 Aluminum ware, Erie cast, Dec 6, p 35
 Amalgamated Association, July 19, p 52
 Call for meeting of tin plate workers, Oct 18, p 55
 Tin plate wage scale, July 19, p 53; 26, p 58
 American Bicycle Company, Sep 6, p 62
 American Brazing Company, Sep 6, p 62
 American Porcelain Company, Dec 6, p 41
 American Radiator Company:
 New plant, July 19, p 48
 Publications, July 19, p 47
 American School of Correspondence, Sep 6, p 49; 20, p 44; Nov 29, p 48; Dec 13, p 35

American Society of Heating and Ventilating Engineers, Oct 4, p 56; N v 22, p 44
 American Spiral Pipe Works, Aug 2, p 50
 American Steam Laundry Company, Cooling plant, July 26, p 50
 American Stove Company, Officers, Sep 13, p 41
 American Tin Plate Company:
 Booklet for roofers, Sep 27, p 63
 Misleading reports, July 19, p 53; Aug 9, p 48
 New black plate process, Aug 9, p 49
 Prices decline, Oct 4, p 51
 Wage scale on tin plate for export, July 19, p 53; 26, p 58; Aug 9, p 49; 23, p 55; Sep 13, p 55; 20, p 60; 27, p 64; Oct 4, p 41; 18, p 55; 25, p 51; Nov 1, p 35, 54
 Antimony in 1901, July 26, p 62
 Apartment house in New York, Nov 22, p 49
 Architects and the roofing question, Aug 2, p 59
 "Are you ready?" Aug 16, p 37
 Argon air valves, Oct 11, p 50*
 Art Metal Construction Company, July 26, p 60
 Asbestos coated rubber, Dec 13, p 35
 Ash cans, L. & G., Sep 6, p 43*
 Ash sifter, Dec 20, p 31*
 Association of Brass and Iron, Steam, Gas and Water Goods Manufacturers, Dec 20, p 40
 Association of Manufacturers and Jobbers of Plumbing Supplies, Sep 13, p 47; 20, p 58
 Athens, International Exposition at, Nov 15, p 38
 Atlantic Coast Master Plumbers' Association, Nov 1, p 44; 15, p 47; Dec 13, p 36
 Atomizer and sprinkler, Lenox, Dec 6, p 35*
 Austrian continuous sheet mill, Nov 29, p 40*

B.

Balancing a combination job of heating, Aug 9, p 41
 Bar folder, Niagara, Nov 29, p 37*
 Bar mill consolidation abandoned, July 19, p 54
 Barnes drill, Nov 22, p 39*
 Basket, Aluminum dipping and plating, Aug 9, p 45*
 Baths, The utility of the spray and shower, Nov 29, p 37
 Bathtub equipments, Aug 2, p 49*; Oct 4, p 62; Nov 22, p 44
 Bathtubs:
 Enameled iron, Aug 16, p 52
 Standard porcelain, Dec 6, p 38*
 Batteries, Recharging dry, Nov 29, p 49
 Beaters, Taplin improved, Oct 18, p 42*
 Behrer, Martin, Portrait of, Oct 4, p 57*
 Belfield, H., & Co., Steam goods, Dec 6, p 39
 Belleville Stove Works, Aug 16, p 40
 Benton Mfg. Company, Dec 20, p 32
 Berger headlight, Aug 2, p 44*
 Berger Mfg. Company, Nov 15, p 56
 Bergstrom Bros. Company, Oct 4, p 46
 Berryman, J. B., Piping materials for steam plants, Aug 9, p 54
 Bibb, B. C., Stove Company, Sep 13, p 43
 Bibbs, New Departure, Aug 2, p 46*
 Bids, Fee for, Grand Rapids Master Plumbers, Sep 13, p 39
 Billow system of fuel oil appliances, Aug 30, p 49
 Bixby, J. L., Jr., Cubical contents charts, Oct 18, p 46
 Blacklock Foundry, Nov 29, p 36
 Blessing, C. A., The Louise Memorial Hospital at Niagara Falls, Dec 20, p 40

Bliss, E. W., Company, Aug 30, p 57
 Boat, Sheet metal, Dec 6, p 46*
 Boiler connection fittings, Lawler, Sep 6, p 55*
 Boiler connections:
 Boiler below range, Sep 13, p 49*
 Boiler too low, Aug 2, p 60* 9, p 58; 30, p 61
 Connecting below range, Dec 27, p 43*
 Connections should be larger, Oct 25, p 60*
 Heating from range boiler, Sep 13, p 58; Oct 4, p 66*
 Heating from water backs, Oct 18, p 57*
 Heating radiator from hotel range, Nov 29, p 49
 Heating water with steam, Sep 6, p 58; 27, p 67*
 Main pipes too small, Nov 15, p 58*; 22, p 50; 29, p 50; Dec 6, p 50*
 Wet or dry return? Nov 15, p 58
 Boiler trade:
 Favorable reports, Aug 9, p 51
 Prices advance, July 5, p 47; Sep 13, p 47
 Boilers:
 Changing water in heating systems, Oct 4, p 66; 18, p 58
 Columbia steam and water heater, Sep 13, p 50*
 Double boiler work, Nov 29, p 45*
 Hammering in range boiler, Sep 13, p 59
 Ideal, Sep 6, p 53
 International, July 5, p 52
 International "F" series, July 19, p 46*
 Location of range boiler, July 12, p 55
 Paragon, Oct 11, p 52*
 Range boiler and water front, Sep 20, p 52*
 Richmond, Sep 6, p 54
 Royal, Nov 29, p 45
 Standard, July 12, p 45; Aug 30, p 49
 Standard 20 series, Aug 23, p 47*
 Sun Ray, July 5, p 55; Aug 2, p 47*
 Walker & Crawford, Sep 6, p 52
 Boiling points of water at different heights of vacuum, July 12, p 45
 Bolts:
 Expansion, July 5, p 46*
 Steel toggle, Oct 25, p 56*
 Bond, Joseph, Death of, Aug 16, p 46*
 Book reviews:
 Art of Enameling on Metal, Aug 9, p 63
 Assaying and Metallurgical Analysis, Dec 20, p 44
 Electro Plating and Electro Refining, Oct 18, p 41
 Heating and Ventilating Buildings, Oct 4, p 63
 Hints on Joint Wiping, Nov 22, p 45
 Manual of Business, Sep 27, p 65
 Manual of Drawing, Nov 15, p 61
 Metal Worker Pattern Book, Oct 11, p 56
 Municipal Year Book, Aug 30, p 55
 National Tube Company's Book of Standards, Sep 13, p 53
 Reference Library of Modern Engineering, Dec 13, p 35
 Steam Heating and Ventilating, July 12, p 53
 Book shelf, Gas pipe, Oct 11, p 49*
 Boston Master Plumbers' Association, Aug 23, p 47
 Boston plumbing school, Oct 25, p 54
 Boynton Furnace Company, Oct 4, p 48
 Brand Stove Company, Oct 11, p 37
 Briquette making in Germany, Nov 8, p 54
 Briscoe Mfg. Company, Dec 6, p 34
 Britannia metal mouthpieces, July 5, p 56
 British Tube Association re-established, July 19, p 48

Broiler, Improved Hein's, Sep 20, p 50*
 Brooklyn Metal Ceiling Company, July 12, p 50
 Broschart & Braun, New York, Dec 20, p 36
 Brown & Wales, Boston, Aug 23, p 49
 Buckwalter Stove Company, Sep 6, p 41
 Buffalo fans and engines, Aug 9, p 53
 Building trade:
 Chicago trade, July 26, p 62; Oct 25, p 38
 Conciliation and arbitration in, Dec 20, p 25
 Higher cost of building, Sep 13, p 39; Dec 6, p 30; 27, p 27
 Western trade, Aug 23, p 40
 Buildings:
 Modern apartment house in New York, Nov 22, p 49
 Tenement house construction in New York, Nov 29, p 29
 Burner, Lindsay vibration, Oct 18, p 48*
 (See also Acetylene gas burners; Oil burners.)
 Business failures for six months, July 5, p 32
 Business methods:
 "Are you ready?" Aug 16, p 37
 Care of prices, quotations and catalogues, Aug 9, p 44*; Oct 25, p 47
 Cost of doing business, Oct 4, p 41
 Courtesy, Value of, Dec 27, p 35
 Enlarging a retail business, Aug 2, p 37
 Help in retail business, Dec 6, p 30
 Keeping track of contracts and jobs, July 19, p 41
 Keeping track of unfilled orders, Oct 4, p 64
 Knowledge of details in business, Nov 1, p 35
 Read trade paper, Aug 2, p 37
 Right way, The, Nov 8, p 31
 "Selling him a boiler," Nov 8, p 48
 Selling organization, Nov 1, p 35
 Shop time system, Sep 26, p 55*
 Weed out old stocks, Nov 15, p 54
 Business situation, Aug 2, p 38; Sep 27, p 44; Oct 18, p 36

ROUND OAK STANDARD OF AMERICA

We have a customer
in Indiana
in a small town
who sold one

Round Oak Furnace

with our assistance
five years ago.

His furnace business
has grown steadily.
Last year he sold
twelve — this year
he says he will
place twenty
Round Oak furnaces.
He also says
his "hard work is done"
that it is now
"no labor to get
the orders."

The quality of the
furnace
and his good work
talk louder than
words or price.

It is a warm subject to force upon your attention at this time of year, but upon the heating of the houses now under way depends the satisfaction of your customers. Your customers will not blame you for hot houses in Summer, but they **WILL** blame you for cold houses in winter. We have manufactured heating and cooking apparatus for many years, and we expect to do so for many years to come, as we believe the policy of careful attention to details and the production of the best goods will continue to be appreciated. Boynton Furnace Company's Heaters (Warm Air, Hot Water, and Steam), Ranges, etc., are made right and sold right. Our customers know this. It is those who do not that we address. If in the market for a complete line, write us. The Boynton Furnace Co., 207 and 209 ^{WATER ST.,} NEW YORK.

GILT EDGE

stands for best when applied to furnaces. The many dealers who have installed and the thousands of householders whose homes have been heated by our furnaces show they like the Gilt Edge, as will be seen by the testimonials they have written. Let us send you a few of them.

The Keystone Joint used in Gilt Edge Furnaces is the only permanent gas tight steel and cast iron joint on the market.

R. J. Schwab & Sons Co.
MILWAUKEE

A FEW POINTS OF SUPERIORITY

Fire pots are of fire clay tiling and never burn out.

Radiator surface in proportion to grate surface unusually large.

Only absolutely gas tight furnace made.

Novelty of construction makes an easy seller.

Tested for fifteen years.

Repairs are seldom necessary.

Are guaranteed to burn hard or soft coal.

No direct draft to warp out of shape, nor packed joints to leak gas.

Katalogue and prices will be mailed you upon application.

FRONT RANK STEEL FURNACE CO., 2301 to 2309 Lucas Ave., St. Louis, Mo.

Perfectly Natural.

A keen observer recently remarked that what displeased him most was to see people try to be what they are not. You're seemingly obliged to sell some apparatus on that basis, but never

"GURNEY" HEATERS,

BRIGHT IDEA, DORIC and 400 SERIES,

You may claim what we claim for them in the fullest confidence. It's never necessary for you to stretch their efficiency, their durability, or their economical fuel consumption. It's never necessary to make any misstatements about their ratings, for each heater is honestly rated and will do exactly what we claim for it. "Gurney" Heaters, by the way, are sold, not on "saying" but on "doing."

You won't have to look far to find people right in your locality who'll help you sell "Gurney" Heaters by their recommendation of them. Write for latest catalogue and agents' particulars.

Why Sell "THATCHER" Furnaces?

Third Reason:

BECAUSE THEY SAVE COAL

"Unless you run a coal yard you will find the ordinary coal eating furnace is hard to sell. 'How much does it cost to run?' is a very early and proper question. You can always meet that question squarely with THATCHER. Thousands of successfully heated homes attest their economy in operation."

Adapted for heating the finer class of dwellings.

Drums of heavy cast iron, absolutely dust, smoke and gas tight.

Castings extra heavy.

Deep sand joint and deep ash pit.

March-Brownback Stove Co.

POTTSTOWN, PA.

An imported rug, a piece of antique furniture, the suit of clothes your tailor makes up especially for you, and a good many other things you probably value at more than their actual worth because of the exorbitant price you may have paid for them.

Perhaps you may have paid \$100.00 for a furnace and it cost you from \$12.00 to \$20.00 for repairs at the end of seven or eight years.

Perhaps your neighbor has a Dighton, heats his house as well as yours is heated, uses less fuel than what you do and don't spend a penny for repairs in ten years.

No doubt you've had a lot of people tell you the Dighton is a cheap furnace?

We think the Dighton is the cheapest furnace ever made.

DIGHTON FURNACE CO., Taunton, Mass.

I can hold my hand over my chimney. No waste heat. I use a Rochester Radiator and save half the fuel.

The greatest leak in household economy is the loss of heat up the chimney. This was supposed to be unavoidable until the **Rochester Radiator** was invented; now it is cheaply and thoroughly controlled by the many cross tubes. Dealers find an ever growing trade. Why not put in a stock and get up a boom in your town?

Rochester Radiator Co.,

100 FURNACE STREET,

ROCHESTER, N. Y.

4,866 sq. ins.

IF YOU ARE NOT SELLING THE

Peck-Williamson Underfeed Furnace

you have not the trade and are not making the money you might. Just a pull or two of the lever feeds the new coal from underneath.

The Underfeed Furnace consumes less fuel than any other furnace ever built. The coal is burnt more slowly. All the heat units from it, as well as from the smoke, are utilized and all smoke eliminated.

Our handsome booklet explains its splendid heating qualities and coal saving.

You may have this booklet and our special plans for selling. Ask for booklet about our Laundry Dryer also.

First on the Market. 150,000 Sold.

430 FLAT BACK.

3 inches in diameter.

STANDARD Oven Indicator

has a dial graduated in the simplest possible manner, as can be seen. This graduation was adopted because every oven has its own peculiarities, and an indicator adjusted to one oven might be incorrect for another. The *Standard* can be adjusted to any oven and has no complicated parts. Made in 3 styles.

Send for circular.

A 62-PAGE PAMPHLET

Comprising a Series of Articles and Letters on *Chimney Troubles and Their Remedies* published under the title

Contains a compilation from the columns of THE METAL WORKER, of articles and correspondence relating to house chimneys, defective flues, and kindred topics, comprising a source of information of the most practical and reliable nature, on overcoming difficulties which occur in the working of chimneys, flues, etc.

To all who are interested in flues and drafts, in their relation to stoves, furnaces and house heating apparatus, this book will prove instructive and helpful.

The Contents are as follows

	Page.
POINTS ON CHIMNEYS	7-32
An illustrated article by J. L. Bixby, Jr., describing many details in chimneys, which cause trouble, and giving remedies. An important table is presented, of the sizes of chimneys required in dwelling houses, based upon the amount of work to be done.	
DEFECTIVE FLUES	33-35
This article presents information resulting from a wide, practical experience of the writer, and gives sound advice on some of the details of chimney construction.	
HOW TO IMPROVE A WEAK CHIMNEY	36-40
VARIOUS FORMS OF VENTILATORS or CHIMNEY TOPS	41-45
CONDENSATION IN STOVE PIPES	46, 47
SMOKE PIPE FOR WOOD FURNACES	48
REMEDYING DOWN DRAFT IN CHIMNEY	49-51
CONNECTED FLUES DESTROY DRAFT	52-55
FAILS TO BAKE ON BOTTOM	56-62

40 good Illustrations help to make the Text clear.

Price, Postpaid 25c.

Furnace Heating.

A Practical and Comprehensive Treatise on Warming Buildings with Hot Air, by William G. Snow, with an Appendix on Furnace Fittings. 170 pages; size, 6 x 9 inches. Cloth bound. Price, \$1.50.

This is the only book that has been brought out which presents a systematic and reliable treatment of the warm air furnace system of heating.

It deals with the various types of furnaces, their construction, proper location and setting, together with furnace fittings, and all matters pertaining to the installation of furnaces and to effective and economical heating by warm air. The subject is discussed for the first time by a competent author possessed of a scientific education and a practical training, who presents positive rules, based on a long experience, for guidance in designing furnace systems for dwellings and other buildings where this popular method is employed. The various details of furnace work are described simply and at such length that the volume will be valuable to all who are in any way interested in the subject. It is recommended to practical furnacemen, to architects, builders and house owners, and to tanners and plumbers in suburban sections who do furnace work. To all these it will prove a reliable text-book and guide.

PARTIAL SUMMARY OF CONTENTS BY CHAPTERS.

Chapter I.—Furnaces—Is devoted to Furnace Construction—The Relative Proportion of Furnace Parts—Secondary Heating Surface—Economy and Efficiency—Heating Capacity and Exposed Wall Surface—Manufacturers' Ratings of Their Own Productions, etc.

Chapter II.—House Heating—Compares Furnaces and other apparatus, and describes Method of Setting Brick and Portable Furnaces—Location and Area of Cold Air Supply—Cold Air Rooms and Air Filters—Return Ducts and Air Circulation—Size of Hot Air Pipes—Location of Registers, etc.

Chapter III.—The Combination System—Discusses Heating Distant Rooms with Radiators—Balancing the System—Location of Water Heaters in Furnace—Capacity of Water Heaters—Size of Radiators, etc.

Chapter IV.—Air—Deals with the Necessity of Ventilation—Water Needed to Moisten Air—Expansion of Air—Velocity of Air in Tubes, etc.

Chapter V.—Heating and Ventilation of Buildings—Considers the Size of Furnaces Required—Fresh Air Room and Supply—Air Circulation—Size of Flues—Use of Stack Heaters—Size of Heating Boilers in Vent Flues, etc.

Chapter VI.—Heating of Public Buildings, Churches and Stores—Is given to the Size of Furnaces Required—Grate Surface in Ventilated Buildings—Air Supply—Size of Heating and Ventilating Flues—Size of Stack Heater, etc.

Chapter VII.—Fan-Furnace Combination System—Is devoted to Positive Warm Currents from Fan Systems—Location of Fan and Driving Apparatus—How Good Furnaces are Aided by Fans—Types and Efficiency of Fans—Area of Ducts and Flues, etc.

Chapter VIII.—Temperature Control.

Chapter IX.—Estimate and Contract Blanks.

Chapter X.—Value of Fuels. The Proper Size for Furnace Chimneys—with tables.

APPENDIX.

Furnace Fittings.—A section of 45 pages dealing with the Making of Furnace Casings—Metal Cold Air Boxes—Making Furnace Bonnets and Collars—Making Pipe and Elbows—Registers—Boxes and Stack Shoes, etc.

Plumbing and House Drainage Problems.

244 Pages; 146 Illustrations; Size, 6 x 9½ inches. Cloth bound. Price, \$1.50.

This volume is devoted to practical plumbing and house drainage, treating many of the most difficult problems arising in the practice. Much of the subject-matter is presented in the form of questions and answers. The answers, as a rule, consist of descriptions of methods of properly installing work, accompanied by appropriate illustrations, which make the text clear. Incorrect ways of doing work are also pointed out, accompanied by examples of successfully installed plumbing and drainage. **Hot water circulation and hot water supply in buildings** are treated at considerable length.

HOT WATER CIRCULATION IN BUILDINGS.

HOT WATER SUPPLY IN VARIOUS BUILDINGS.

Steam Heating Problems.

233 Pages; 109 Illustrations; Size, 6 x 9 inches. Cloth bound. Price, \$1.50.

This book contains a compilation of questions, answers and descriptions relating to Steam Heating and Steam Fitting, expertly treated and adapted to the wants of those who design, construct and have charge of steam-heating apparatus. The work embodies results of some of the best experience and practice in the trade, presenting solutions of many difficult problems connected with the steam-fitter's work. We reproduce some of the subject-matter headings of Steam Heating Problems, which are of interest as indicating the practical character of the problems and questions which are treated.

BOILERS.

- On blowing off and filling boilers.
- Where a test-gauge should be applied to a boiler.
- Domes on boilers; whether they are necessary or not.
- Expansion of water in boilers.
- Cast vs. wrought iron for nozzles and magazines of house-heating boilers.
- Pipe-connections to boilers.
- Passing boiler-pipes through walls; how to prevent breakage by settlement.
- Heating-boilers. (A problem.)
- Isolating-valve for steam-main of boilers.
- On the effect of oil in boilers.
- Proportions for rivets for boiler-plates.
- Iron rivets and steel boiler-plates.
- Is there any danger in using water continuously in boilers?
- A supposed case of charring wood by steam-pipes.
- Domestic boilers warmed by steam.

VALUE OF HEATING-SURFACES.

- Computing the amount of radiator-surface for warming buildings by hot water.
- Calculating the radiating-surface for heating buildings—the saving of double-glazed windows.
- Amount of heating-surface required in hot-water apparatus boilers and in steam-apparatus boilers.
- Calculating the amount of radiating-surface for a given room.
- How much heating-surface will a steam-pipe of given size supply?
- Coils vs. radiators and size of boiler to heat a given building.

- Calculating the amount of heating-surface.
- Computing the cost of steam for warming.

RADIATORS AND HEATERS.

- Improper position of radiator-valves.
- Hot-water radiator for private houses.
- Remedying air-binding of box-coils.
- How to use a stove as a hot-water heater.
- "Plane" vs. "Plain" as a term as applied to outside surface of radiators.
- Relative value of pipe on cast-iron heating surface.
- Relative value of pipe on steam-coils.
- Warming churches (plan of placing a coil in each pew).
- Warming churches.

PIPE AND FITTING.

- Steam-heating work—good and in different.
- Piping adjacent buildings: pumps vs. steam-traps.
- True diameters and weights of standard pipes.
- Expansion of pipes of various metals.
- Expansion of steam-pipes.
- Advantages claimed for overhead piping.
- Position of valves on steam-riser connection.
- Cause of noise in steam-pipes.
- One-pipe system of steam-heating.
- Air-binding in return steam-pipes.

- How to heat several adjacent buildings with a single apparatus.
- Air-binding in return steam-pipes, and methods to overcome it.

VENTILATION.

- Size of registers to heat certain rooms.
- Determining the size of hot-air flues.
- Window ventilation.
- Removing vapor from dye-house.
- Calculating sizes of flues and registers.
- On methods of removing air from between ceiling and roof of a church.

STEAM.

- Economy of using exhaust steam for heating.
- Heat of steam for different conditions.
- Superheating steam by the use of coils.
- Effect of using a small pipe for exhaust steam-heating.
- Explosion of a steam-table.

CUTTING NIPPLES AND BENDING PIPES.

RAISING WATER AUTOMATICALLY.

MOISTURE ON WALLS, ETC.

MISCELLANEOUS.

- Heating water in large tanks.
- Heating water for large institutions and high city buildings.

- Questions relating to water-tanks.
- On heating several buildings from one source.
- Coal-tar coating for water-pipe.
- Filters for feeding house boilers.
- Other means of clarifying water.
- Testing gas-pipes for leaks, and making pipe-joints.
- Differential rams for testing fittings and valves.
- Percentage of ashes in coal.
- Automatic pump-governor.
- Cast-iron safe for steam-radiators.
- Preventing fall of spray from steam-exhaust pipes.
- Heating and ventilation of a prison.
- Amount of heat due to condensation of water.
- Expansion-joints.
- Resetting of house-heating boilers—a possible saving of fuel.
- How to find the water-line of boilers and position of try-cocks.

MISCELLANEOUS QUESTIONS.

- Applying traps to gravity steam-apparatus.
- Connecting steam and return risers at their tops.
- Power used in running hydraulic elevators.
- On melting snow in the streets by steam.
- Arrangement of steam-coils for heating oil-stills.
- Converting a steam-apparatus into a hot-water apparatus and back again.
- Condensation per foot of steam-main when laid under ground.

These books will be sent postpaid on receipt of price, \$1.50 per copy.

DAVID WILLIAMS COMPANY, Publishers, 232-238 William Street, New York.

The Kelsey Warm Air Generator.

A HEATING APPARATUS with from nine to seventeen vertical corrugated cast iron flues, or Sections, forming the Fire Cylinder and Combustion Chamber, and having 65 square feet of heating surface to each square foot of grate surface.

Warms thoroughly and to the proper temperature great volumes of air, by passing it through the flues, and conveys it to every part of the building.

Provides heat and most perfect ventilation for Residences, Churches and School Buildings.

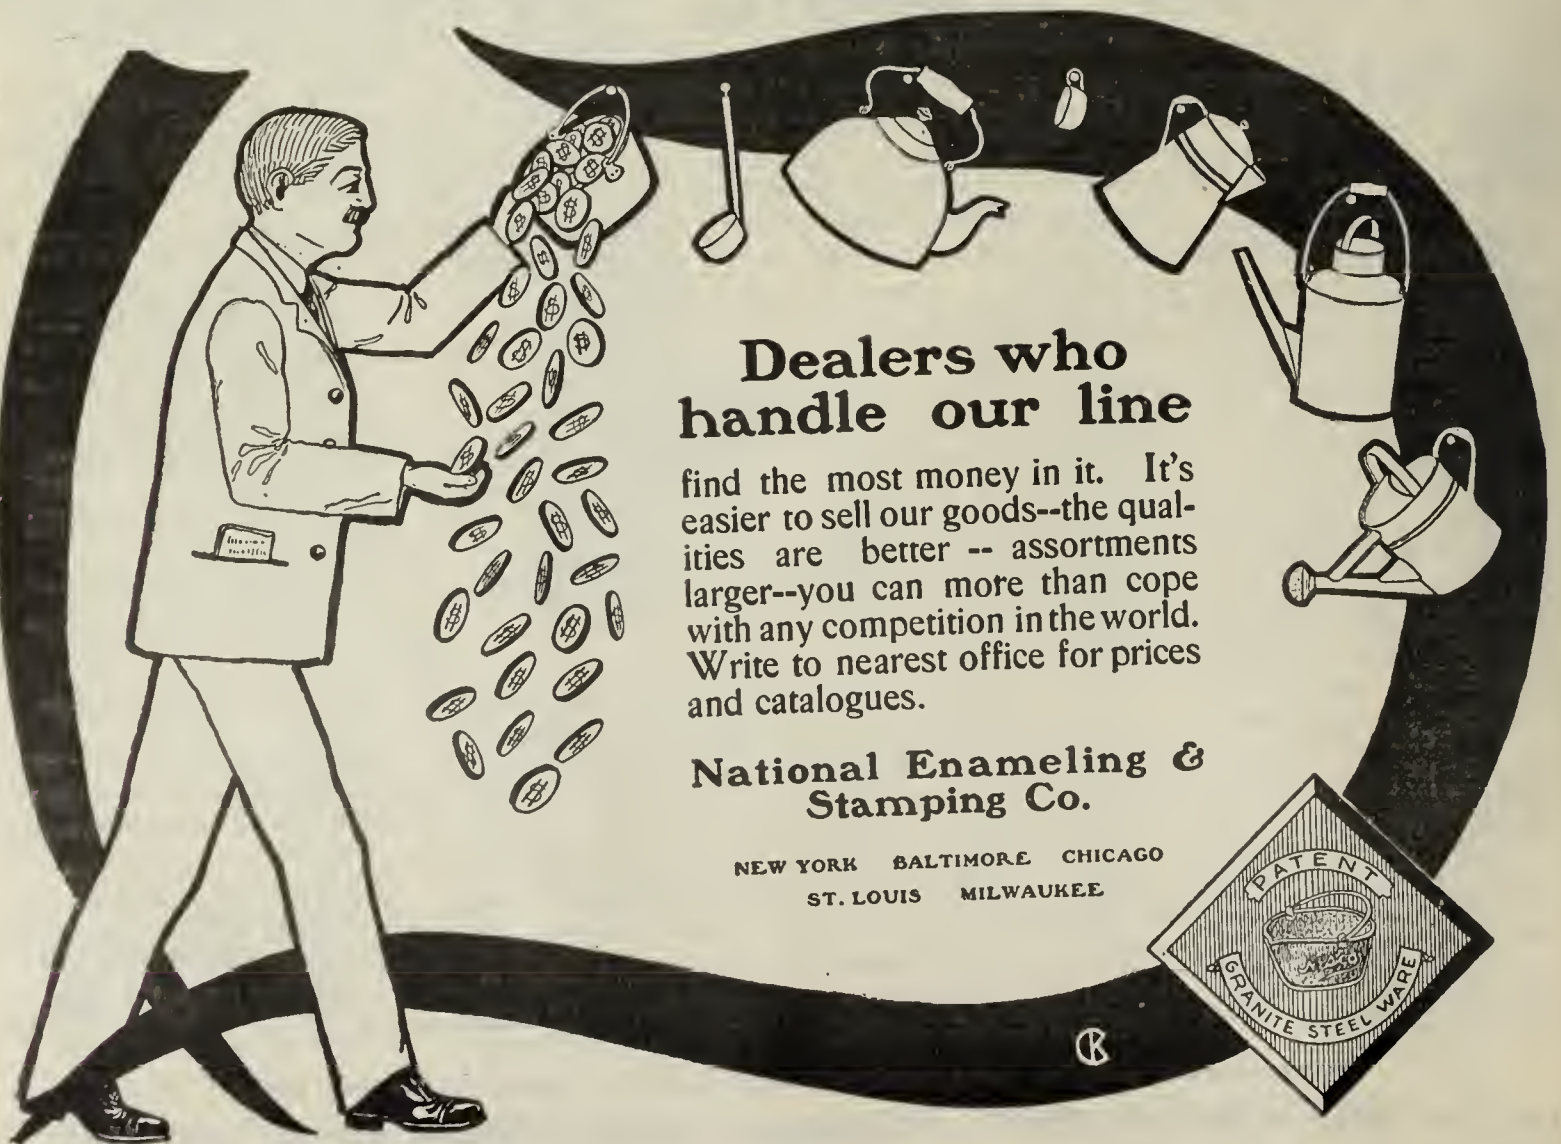

Accomplishes results which lead to further sales at satisfactory profits for the dealer.

Send for 164 Page Book of "Opinions." 20,000 in use.

The Gas and Oil Stove Trade.

Observers have been impressed with the increase in the demand for gas and oil stoves since the inauguration of the coal strike. The rise in the price of coal has prepared the minds of the public in general to receive with more interest information about other kinds of cooking apparatus than the universally used coal stove. Many of the older and more conservative citizens, who have heretofore shown little or no interest in the new fangled cooking devices used by their neighbors, are now inclined to listen attentively to the explanations of a gas range, a gasoline stove or a blue flame oil cooking apparatus given at the store which they have taken the trouble to visit for the purpose of securing information. Those dealers who for a number of years have carried such goods in stock are now reaping the reward of their enterprise. This should suggest to all dealers in stoves and house furnishing goods that something more than a mere display of gas and oil stoves in the store is necessary to reap the full benefit of the conditions which the coal strike has brought about. Most of the manufacturers of what has heretofore been termed "summer cooking apparatus" are willing to furnish circulars explaining the advantages possessed by their goods. The dealer who takes advantage of this opportunity to secure circulars and have them distributed at the houses of prospective purchasers will be making an effort that should materially increase his sales. If the distribution is made by some one who can intelligently explain the goods, and particularly if the visits are made in the forenoon, when the kitchen is in use, the effect will be greater, and it is also possible that orders for repairs for the coal stoves in use could be secured, which would help to defray the expenses of the canvass. A special effort to increase their trade in the line indicated has evidently been made by dealers in different sections, and as a result the manufacturers and jobbers of gas, gasoline and oil stoves, have been well occupied.

Production of Pig Iron by Grades.

James M. Swank, general manager of the American Iron and Steel Association, has rendered the iron trade a great service in collecting the statistics of the production of pig iron according to the different grades. This information is for the first time embodied in the statistical report of the association issued last week. For years this report has given the quantity of spiegeleisen and of Bessemer and basic pig iron annually produced, but it has always been a matter of conjecture as to

how much of the remaining pig iron product consisted of foundry and how much of forge iron. Exact figures are now available. In collecting these statistics for 1901 care was taken to secure figures of production for 1900, so that a comparison can be made of the output of the several grades in these two years. The following table of total production of pig iron in the United States is taken from the report:

Grades.—Gross tons.	1900.	1901.
Bessemer and low phosphorus.....	7,978,209	9,589,939
Basic	1,072,376	1,448,850
Forge	793,092	639,184
Foundry	3,037,689	3,186,348
Malleable Bessemer.....	173,413	256,532
Charcoal	339,874	360,147
White and mottled and miscellaneous....	129,909	97,374
Spiegeleisen and ferromanganese.....	255,977	291,461
Direct castings from furnace.....	8,703	8,522
Totals.....	13,789,242	15,878,354

These figures show that in 1901 over 60 per cent. of the pig iron product was Bessemer and low phosphorus, over 20 per cent. foundry, over 9 per cent. basic, over 4 per cent. forge, over 2 per cent. charcoal, about 2 per cent. spiegeleisen and ferromanganese and 1.6 per cent. malleable Bessemer. Perhaps the most noteworthy fact clearly established by Mr. Swank's figures is that the great increase in the production of pig iron from 1900 to 1901 was practically confined to the grades used for the manufacture of steel, that there was only a slight increase in the production of foundry pig, and that the make of forge iron for puddling purposes fell off. The figures eloquently prove, too, to what a low point relatively the latter has fallen.

The Rights of Employers.

An interesting and important decision bearing on the rights of employers and employees was handed down last week by the Supreme Court of Wisconsin. The decision declares that a State law which prohibits any employer from discharging anybody because he belongs to a labor organization is contrary to the employers' constitutional rights and is therefore void. The Wisconsin Court recognizes the right of the workman to combine in a labor organization, and also his right to refrain from joining such an organization. In other words, the workman is regarded as master of his own labor, and he may sell it to whom and under what conditions he pleases. The same doctrine, however, is held to apply to the employer, and the Court points out that if any employer's liberty as to whom he will hire, and under what conditions he will hire him, be curtailed by legislation, the similar fundamental liberty of the laborer can likewise be curtailed and he may be compelled to work against his will for persons, or under conditions, unsatisfactory to him. If an employer can be punished for refusing to employ union labor, the union employee can logically be punished for leaving work in obedience to his union. The right to employ, or be employed, the Court holds, is equal, and neither is subject to legislative restriction. Therefore, the law forbidding an employer to follow his own will in the choice of workmen and employ union or nonunion men at his pleasure, is set aside as violating his primary rights under the Constitution. This decision is of peculiar interest, as several States have such laws on their statute books. For example,

in the New York Penal Code there is a law which makes it a misdemeanor, punishable by not more than six months' imprisonment and \$200 fine, to compel any person to agree not to join a labor organization as a condition of securing or continuing employment. It is not unlikely that the constitutionality of this law may now be tested. Several similar laws have been set aside in New York State within the past few years, and the section of the code making it a misdemeanor to dismiss employees for membership in a labor union, or to make nonunionism a condition of employment, is not unlikely to meet a similar fate, as it appears that its constitutionality has never been passed upon by a Court of Appeals.

Municipal Ownership.

Municipal ownership of public utilities is not an untried experiment in this country. In fact, few cities or incorporated towns can be found in which some effort has not been made in this direction. Usually it takes the form of furnishing the water supply, but occasionally the municipality will also enter into the business of manufacturing gas or generating electric current for the use of the citizens. Latterly a strong sentiment has sprung up in favor of greatly extending the functions of municipal government by assuming the ownership of street railways. The apparent awakening of general interest in this subject makes it seem to be a new proposition for America, notwithstanding it is old enough to have developed some conspicuous failures, which should have a sobering effect on the enthusiasts who favor municipal ownership as a great stride in the direction of a social millennium. The strength of the arguments made by those who would have the management of gas, electric light, street railway and other public necessities vested in the city has hitherto largely been based upon the reports of low cost and high efficiency of the service secured in European cities in which this policy prevails. To such an extent has public ownership of public utilities been carried in Europe that it is termed "municipal trading" in contradistinction to enterprises conducted under private management. It must be acknowledged that the reports regarding such municipal trading have been uniformly favorable, but the success in Europe has been attributed by conservative writers to the great difference in the administration of civic affairs abroad and at home. For instance, street paving, street cleaning and garbage collecting are functions conducted by municipal governments in this country as well as abroad. Now, if municipal ownership in itself insured good results every American city should be as clean and as well paved as the average European city. It is unnecessary to ask if this is the case. It is further unnecessary to ask why it is not.

Some Results in England.

The reports now beginning to come from abroad are projecting discordant notes into the great chorus of praise of municipal trading. The most important development has occurred in London. Here an organization named the Industrial Freedom League has been formed to secure protection from the burdens which municipal ownership is imposing on the citizens. It is composed of wealthy and influential men, including noblemen, members of Parliament, manufacturers and merchants. They assert that they are being oppressed by what they term the injudicious course of the London authorities, claiming that a municipality cannot carry on the business of operating tramways and furnishing electric light and gas without extravagance because the boards or councils, drawn from all classes and ranks of society, attempt to conduct enterprises of which they have

no knowledge. It is stated that until the South African War broke out Great Britain had been steadily reducing its national debt, the twenty years from 1879 to 1898 showing a reduction of about \$650,000,000. On the other hand, during the same period, the debt of British municipalities had increased fully \$750,000,000, with a further large increase since 1898. Inasmuch as the money must come out of the same pockets, whether taxes are levied to meet the debt charges of the nation or of municipalities, the object of the league is to check the growth of local indebtedness. A definite criticism of the policy of municipal trading is presented in the case of the tramways of London. Those in the north of London, which are leased to a company, are so well managed that a rental can be paid which not only provides interest and sinking fund upon cost, but leaves a substantial surplus amounting to upward of \$200,000 per annum. The tramways in the south of London, worked by the London County Council, yield an insignificant profit. In other English towns the fares are deliberately put at so low a figure that actual loss results, so that the masses enjoy cheap transportation facilities for which the classes, the real taxpayers, must pay. It is highly probable that if all the facts were known regarding the administration of public utilities by European cities American advocates of municipal trading would not be able to paint such glowing pictures in support of that policy.

Exports of Manufactures.

The exportations of manufactures from the United States during the 11 months ending with May, 1902, was greater than that of any preceding year, except in the one item of iron and steel. The total value of exports of manufactures for the 11 months indicated amounted to \$371,647,609, against \$378,533,496 in the 11 months of 1901, or nearly \$6,885,887 less than those of last year, whereas the exports of iron and steel manufactures for the 11 months dropped over \$18,000,000 as compared with the corresponding months of last year. From this it would appear that the exports of manufactures other than iron and steel were nearly \$12,000,000 greater than for the corresponding months of the preceding year. While the exports of iron and steel have been decreased, importations of iron and steel have increased, showing a gain of \$7,000,000 for the eleven months ending with May, 1902, over the corresponding months of the preceding fiscal year. Taken as a whole, and leaving the iron and steel item out of the account, the record makes it apparent that the exportation of manufactures from the United States in the present fiscal year is greater than for the same period in any preceding year in the history of our foreign commerce.

Business Failures for Six Months.

Reports to R. G. Dun & Co. show commercial failures for the half year to have been 6165 in number, with \$60,374,856 liabilities, against 5759 insolvencies in the corresponding months of 1901, involving \$55,804,690, and 5332, with \$74,747,452 liabilities in 1900. Of this year's aggregate, 1418 were in manufacturing for \$24,940,020, 4410 in trading for \$29,145,622 and 337 in other commercial lines for \$6,289,214; as compared with 1265 in manufacturing last year for \$21,691,048, 4189 in trading for \$24,864,207 and 305 miscellaneous with liabilities of \$9,249,435. In every respect the failure statistics exhibit a striking decrease for the second quarter as compared with the first three months of the year. In manufacturing lines there were 672 defaults, against 746 in the first quarter, while liabilities were \$10,164,116, compared with \$14,775,904; and trading failures numbered 1908, against 2502, and amounted to \$13,628,295, against \$15,517,327. The improvement was most striking in financial insolvencies, however, only eight being reported in the second quarter for \$1,209,100, against 26 in the first quarter, with liabilities of \$15,588,663.

RANGE PRICES ADVANCE.

Those who have watched the conditions which have an important bearing upon the stove trade, particularly the advances in the price of iron, will not be surprised to learn of advances in the price of stoves. On Monday afternoon the manufacturers of what are known as "builders' ranges," doing business in New York and vicinity, held a meeting at which it was determined to advance the price of this line of goods 5 per cent., which action was generally agreed to. This class of goods is largely supplying the demand for coal cooking apparatus in many of the larger cities, and there should be no difficulty on the part of the comparatively few manufacturers who produce them in reaching an agreement to market this product at a satisfactory profit, as there seems to be a general feeling that in the past these goods have been sold at entirely too low a price.

The action of this small body of manufacturers in reference to one particular line of goods is evidence of the feeling that exists as to the advisability of advancing all lines of stoves, and it is not improbable that, as the busy season approaches, further advances covering all lines, will be made. There are those who feel that in view of the scarcity of iron and the difficulty of securing prompt supplies, the price of iron will be no lower, while it is very clear to them that labor and supplies will hold to the present level. Already reports indicate that some stove foundries have no supply of iron ahead, and that in some instances they have been forced to run on shorter time. If this has the effect of making stoves scarce those who have bought early and secured their stock will have an advantage over their less fortunate *confrères* in the trade. It is not difficult to find those who are already ahead of last year in the volume of business done up to date, while some houses, in view of the outlook, are considering the advisability of making less strenuous efforts to secure business.

The Thompson Oil Burner.

For a long time efforts have been made to produce a burner which would permit of the satisfactory employment of oil as a fuel in connection with hot air furnaces for heating dwelling houses; but, until recently, with indifferent success. The obstacles in the way have been many by reason of the peculiar properties of oil and the difficulties in connection with carbonization. It is well known that oil requires a high temperature for vaporizing, and that this temperature must be maintained until the vapor is consumed, else a smoky flame results. Inventors, however, have continued their experiments in the direction of overcoming these obstacles, stimulated no doubt in some measure by the increasing discoveries of oil fields and the advantages which would result from the use of oil as a fuel in sections of the country where other kinds of fuel are not so convenient or economical. Among those who have given the subject careful attention is R. S. Thompson of the Springfield Furnace Company, Springfield, Ohio, inventor of the Thompson tubular gas furnace made by this concern. After long research and study of the chemistry of oil, together with a careful consideration of what is required in order to successfully employ it, in a hot air furnace for heating purposes, he has produced a burner which, it is claimed, accomplishes the objects sought. We present herewith a general view of the device.

In describing the burner, Mr. Thompson states that, so far as it has been possible to establish by somewhat lengthy tests, there has been no trouble with regard to carbonization. This has been avoided by carefully studying the conditions which are required to secure carbonization at the refineries where they purposely secure it in order to obtain the lighter and more valuable oils. Having learned of the conditions under which it was secured where it was desired, Mr. Thompson so constructed his burner as to avoid these conditions. The oil is supplied to the burner by gravity, an elevation of at least 3 feet being necessary in order to obtain successful results, while an elevation of 8 feet is about the limit which will enable the burner to work to advantage. Where the elevation is greater than 8 feet there is

a tendency of the flame to blow, although this would probably be overcome by reducing the size of the supply pipe. The oil is vaporized in the generator which is at the back of the burner, and therefore not shown in the engraving.

It is a reasonable assumption that, in the course of time, there will accumulate in this generator a sufficient amount of non-volatile matter to prevent the burner from working perfectly, and provision is made for emptying the generator at any time by simply closing the valve on the oil supply pipe and opening a stop cock at the bottom of the generator, which is entirely away from the fire, and therefore not liable to become heated or troublesome. The construction is such that the generator can be emptied, it is claimed, in half a minute, and the fire started immediately. From the tests which have been made, Mr. Thompson is of the opinion that this will not need to be done more frequently than once a month, although it can be done oftener if deemed advisable.

Two methods of lighting are provided with each burner. One is with gas, where illuminating gas is available, a 1/8-inch gas pipe being connected with the bottom of the oil gas pipe and having a separate jet. The gas is turned on and the burner lighted like an ordinary gas burner. About ten minutes are required to make the burner sufficiently hot for the oil, after which the oil valve is opened and the oil gas enters through its own jet, being lighted on the face of the burner by the

The Thompson Oil Burner.

gas flame, after which the gas is shut off. This, it is claimed, makes a very neat and convenient method, as it is not necessary to watch the burner while it is being heated.

The other method is to allow a little of the oil to run through the burner into a gutter around the edge, not shown in the cut, which is filled with asbestos wool. This is lighted and when it has burned long enough to heat the burner the oil gas is turned on and the burner is immediately in operation. In either case, only one match is needed, but with the oil it is necessary to remain with the burner until it is ready to start, for, if forgotten, it will burn out, the burner become cold, and the whole operation will have to be done over again. Where preferred, wood alcohol can be used instead of oil for starting the burner. This does away with the smoke from burning the oil in the gutter.

The claim is made that the flame is perfectly steady and there is no noise, except a slight hissing sound of the escaping gas, similar to the ordinary gas burner, only a trifle louder. The flame is smokeless, and is of a beautiful green where it issues from the slots in the sides of the burner, shading off to blue, violet and purple in the upper part of the flame. Mr. Thompson points out that there is no difficulty in regulating the flame, and that in the test it was turned down to a point where there was nothing left but a little flickering blue flame, running back and forth over the face of the burner. It was continued in this stage for an hour so as to ascertain whether when the fire was turned very low the generation of gas would cease. At the end of an hour the valve was opened full and the burner started at once with full power, showing that even when turned lower than it ever would be in practice there was no interference with the generation of gas. This heretofore has been one of the great difficulties with the burners, for if they were turned low they would cease to generate gas, and the oil would begin to run from the gas valve.

FURNACE RULES AND CALCULATIONS.—II.

BY JAMES A. HARDING.

Following the line of theoretical calculation to determine furnace capacity pursued in a previous article, additional elements of the furnace heating problem are evolved in calculating the sizes of warm air pipes. In making the latter calculation it is unavoidable that two of the factors employed be assumed—viz., the maximum temperature of the heated air and the maximum velocity of air through the pipes.

It will be obvious that but one calculation, based upon the extreme conditions of the contract, will be necessary; for, as the lesser is always contained within the greater, in all conditions of weather less severe than the said extreme the fire will be regulated to provide for the desired temperature in the house with a lower temperature of the heated air, and consequent less velocity of air through the pipes.

From a hygienic standpoint, I think it desirable that the temperature of the heated air should not exceed 140 degrees F. at the register, and at this temperature the net working velocity for the whole caliber of a warm air pipe, allowance being made for friction, will not exceed an average of 3 feet per second—equal to 10,800 feet per hour—which figure I will use for convenience.

For establishing a general rule, it is necessary to deal with averages in this matter, inasmuch as a positive and constant flow of warm air through pipes, induced by force of gravity and unaided by mechanical means, is menaced by an endless variety of conditions inherent in a dwelling house, any one of which is sufficient to seriously retard or entirely prevent circulation.

What these conditions are and how to provide for them constitute the elements of furnace heating which are solvable by experience only, and not susceptible of being reduced to formulæ. This latter statement does not imply that a rule for determining the size of suitable warm air pipes cannot be evolved. It simply means that after the machine is well built and entirely completed a furnace doctor may be required to set it going as intended.

In pipes leading to rooms where suitable provisions for ventilation have been made the flow of air will be generally constant. But as the majority of rooms in dwelling houses are not provided with means of ventilation, and many such rooms are isolated, their space confined by closing the doors and the rooms subject to wind pressure from exposure to high winds, it is obvious that the size of the warm air pipe becomes, in many cases, the least important detail of the provisions for heating. This digression is indulged in simply to point out the inexactness of the science of furnace heating, and that cut and dried rules, while of value to an experienced man and a safeguard from blunders, will not make experts of the inexperienced.

To return to the main subject, I will treat one of the rooms of the house referred to in my previous article. For example, the dining room: Its glass surface is 96 square feet; exposed wall surface, 184 square feet; cubic space, 2933 feet. I compute the incidental ingress of cold air to a first-story room of an ordinary dwelling to be twice its contents per hour. In the present case it will equal $2933 \times 2 = 5866$ cubic feet. The total equivalent glass surface of this room, or heat units required to warm it to 70 degrees F. in zero weather, will be

$$96 + \frac{184}{4} + \frac{5866}{55} \times 70 \text{ degrees} = 17,430. \text{ These 17,430 heat units are to be supplied to the room by means of heated air introduced at a temperature of 140 degrees F.}$$

The outdoor temperature being 0 degree F., each cubic foot of air at 140 degrees will contain $\frac{140}{55} = 2.5$ heat units; and the total volume of air at 140 degrees required per hour will be $\frac{17,430}{2.5} = 6972$ cubic feet. The velocity of air in the pipe being 10,800 feet per hour, the caliber or cross sectional area of the pipe should be

$\frac{6972}{10800}$ square foot, which equals 93 square inches, or a pipe of 11 inches in diameter.

We thus establish a rule for determining the size of a warm air pipe as follows—viz.: Multiply the total glass surface equivalent of the room by the difference in temperature (indoors and out) and divide the product by 2.5. Divide the quotient thus obtained by 10,800, and the result will be the area of the warm air pipe in square feet or fractional parts thereof.

With regard to the size of register, it is simply necessary to provide for a free area of opening a trifle in excess of the pipe area in order to make due allowance for the friction incident to the passage of air through it. The free area of a register will average two-thirds its dimensions, and if the full area of its opening is one-half larger than the area of the pipe it is sufficient.

In a future paper it will be my purpose to introduce certain corrections or additional elements to the calculations previously made with a view to rendering them sufficiently correct for practice; also to reduce them to simple formulæ.

The Graf Acetylene Gas Range.

We present herewith a general view of a range which is intended to use acetylene gas as a fuel and which is being introduced to the trade by the Union Light &

The Graf Acetylene Gas Range.

Heat Company, 106 and 108 East Second street, Cincinnati, Ohio. The range is said to be so made that there is no gauze to burn out, no odor, no flashing back, and no waste of heat. Reference is made to the perfection of combustion, ease and simplicity of operation, and safety; also to the fact that all modes of cooking can be accomplished with the range. There are no complicated parts to get out of order and no wire screens to renew. The Graf is made with two, three and four burners in the top surface and with oven measuring 16 x 19 inches in size. The top of the reservoir makes a convenient warming shelf. The company occupy a five-story building at the address named, the equipment being of the modern type, including special machinery and many labor saving devices.

THE PAXSON-WARREN SAND BLAST SYSTEM.*

BY A. G. WARREN OF PHILADELPHIA.

The sand blast process has been before the public for more than 30 years, but not until the last ten years has it come into use in the foundry. Although not yet universally used, the merits of the sand blast are fast being recognized, and quite a number of plants have been installed during the past two years. The improvements made in air compressors and the more general use of compressed air, have, in a large measure, been responsible for this. It is not until comparatively recently that there has been on the market an efficient American built sand blast machine. The machine itself should be strongly built, to stand rough usage of unskilled labor. As damp sand will clog up any sand blast, hand holes should be so located that the obstruction can be removed at once without much trouble. I have seen with the use of the double shell sand blast fully an hour required to remove some damp sand. The machine had to be disconnected and hung up by a hoist so that the sand could come out through the top.

With our improved sand blast machine all this trouble is obviated. It has a single shell, no inside hopper, all parts are accessible through hand holes and all parts liable to wear can be easily replaced. The valve at the top of the machine controls the air supply, the

The Paxson-Warren Sand Blast System.

one at the bottom regulating the supply of sand. The sand is fed in through a valved opening in the top head, which is closed when the machine is in operation. To operate, turn on the air and direct the jet of sand and air against the casting to be cleaned. The air serves to give a high velocity to the sand, which does the work. A specially designed helmet is used to protect the face of the operator. The most wear comes on the hose and nozzle. For hose we use a grade specially made for us; it is practically pure Para rubber, and will last, with constant use, from six months to one year. Length of hose may be used up to 50 feet, 12-foot lengths being long enough for most requirements. It has been found that hard iron tips and nozzles give the best satisfaction.

POINTS TO BE CONSIDERED.

An important point not to be overlooked is the quality of sand which should be used in these machines. It should be hard and tough and not too fine, and thoroughly dried and cooled before using, so that it will not steam and clog up the machine. Care should be taken not to overheat the sand, for this will cause it to break up, and a good deal of its efficiency is destroyed. To avoid trouble, it is necessary to have a good air compressor. The idea that because only a low pressure is used any old machine will do is a wrong one. As there are a number of first-class machines on the market, it is not necessary to mention any particular make. The compressor selected should have a confined suction, so that cold air can be supplied to it and thus avoid taking in more moisture than necessary. It is a well-

known fact that cold air carries less moisture in suspension than hot air. The receiver should be located near the sand blast in order to trap out any moisture that may condense in the pipe. Either a belt or steam driven compressor may be used, as best suits the power conditions of the plant where it is installed. Where there is ample engine power available it is best to use a belt driven compressor, because a large engine uses steam more economically than a small steam driven compressor. The best place to locate the air compressor is in or near the engine room, so that the engineer can take care of it. With the proper size of pipe air can be conducted a long distance with very little loss in pressure. The number of cubic feet of free air required per minute will vary according to the opening in the nozzle and the pressure required to do the work. For brass castings 10 pounds pressure is sufficient; on gray iron castings 15 to 20 pounds is generally used; and for steel castings 25 to 30 pounds is required. Experience has proved that a large amount of air at a low pressure will do more work than a small amount at a high pressure.

The sizes of openings in the nozzles commonly used are $\frac{3}{8}$, $\frac{1}{2}$, $\frac{5}{8}$, $\frac{3}{4}$ and $\frac{7}{8}$ inch. Many of the compressor catalogues give the amount of air that will be discharged through different sized orifices at certain pressures. As the sand takes up some room, it is obvious that the figures given will be ample for this service.

SPECIAL COMPRESSOR RECOMMENDED.

It quite frequently happens that an establishment having a high pressure air service already installed will consider the advisability of putting in a sand blast plant. One of the first questions arising is whether the high pressure air can be reduced. While this can be done it is not economical. Take, for example, a sand blast for cleaning gray iron castings, using air at 20 pounds pressure, through $\frac{1}{2}$ -inch nozzle, the amount of free air required would be about 120 cubic feet per minute. To compress this amount to 20 pounds requires about 9 horse-power. To compress the same quantity to 80 pounds would take about 23 horse-power. As there is no power or advantage gained by reducing, there would be a loss of about 14 horse-power, and the total loss for a year would amount to nearly the cost of a special compressor for this service.

In the preceding part of this paper the sand blast proper and the compressor for furnishing the blast have been described. As the sand blast makes a large amount of dust it is customary in most cases to have it installed in a room by itself, of sufficient size and conveniently arranged to handle the work. In all cases I would strongly advise using an exhaust fan to take away the dust. The size of fan will vary according to the size of the room; size of sand blast and amount of dust to be exhausted. It is better policy to install a large fan and run it a medium speed than to run a smaller fan at a high speed to do the same work. While the first cost may be a little more, the difference will easily be made up by the horse-power saved. Where it is objectionable to exhaust the dust out doors it becomes necessary to install a washer that sprays the dust as it is drawn through, so that the exhausted air is practically clean. The dust settles to the bottom of the washer as mud, and occasionally has to be shoveled out.

USING SAND OVER AND OVER.

Where the sand blast is used on a large scale it is an advantage to have an arrangement for preparing sand so that it can be used over and over. In this case a hopper is located in the center of the room, or to one side, and covered with a grating. The hopper discharges into an elevator boot, from which the sand is elevated and fed into a revolving screen, where the fine sand is screened out into a dust box and the tailings fall into the sand box, which is above the sand blast. From the sand box the sand is fed back into the sand blast as required. With this scheme the fine sand does not get into the washer or fan, consequently the washer does not have to be cleaned out as often. The belt elevator is a positive device, and when it is properly fed gives good satisfaction. As the conditions in any two plants are never exactly alike it requires considerable thought to get the best arrangement and one that will give the best satisfaction.

For cleaning large amounts of small castings a sand blast tumbling barrel is used to advantage. Capacities of these barrels vary from 5 to 10 tons per day. The barrel, mounted on rollers, is filled less than half full and caused to revolve very slowly, say three or four revolutions per minute. The sand blast jets are introduced through the ends of the barrel, and as the barrel revolves each casting comes in contact with the blast. The time required to clean one charge varies from 20 to 30 minutes. The advantage of this method is that the castings are thoroughly cleaned and the sharp corners preserved. The barrel itself is covered with a sheet iron casing, which is connected to an exhaust fan and washer, if necessary.

* Paper read before the Philadelphia Foundrymen's Association, June 4, 1902.

In comparing the sand blast process with other methods of cleaning it is unfair to make comparisons with methods where the castings are only half cleaned. In the bathtub business the sand blast is almost an absolute necessity on account of the labor saved, and because it is the best way to prepare tubs for enameling. On castings to be machined there is a great saving on the tools in the machine shop. The sand blasted casting takes paint better and has a more finished appearance than a casting cleaned in any other way. In most cases, where the sand blast is properly installed, it should pay for itself in two or three years. The sand blast is not confined to the foundry alone, but is extensively used for removing scale and rust from sheet iron and structural work, for cleaning brazed joints and for cutting and cleaning marble and other stones; for cleaning pieces to be galvanized it is of great service, as it does away with the possibility of the acid eating into the metal and impairing its strength.

DISCUSSION.

In the course of discussion on this paper the question as to the best place to take air from the tank was asked, and Mr. Warren thought the best effect was obtained in taking it from the top, but on account of moisture it was advisable to run an extra pipe to near the bottom of the tank, where the moisture could be held in a cup like arrangement. Some prefer to allow the air to enter the tank at a tangent, causing the flow of air to strike the sides of the tank, and the moisture then runs down the sides.

CONSOLIDATION VS. SURVIVAL OF THE FITTEST.

BY W. R. M.

If in fine residences the steam and hot water installations were designed and executed with the average intelligence which dominates the ordinary setter of the average hot air furnace, their glory would soon depart. No other system could survive the general treatment administered to the hot air furnace system by manifold joints between combustion chamber and hot air chamber; by overestimating the capacity by the dealer; by hasty and careless packing of joints by the setter and by the fervent ejaculations of disapproval by the householders, with other happenings and incidentals too numerous to mention, all of which contribute to bring the present system of furnace work into disrepute. The very fact that under these conditions the furnace survives at all marks the "survival of the fittest."

Of course there are furnaces and furnaces. Many of them are installed with the rare skill and painstaking effort only acquired by years of practical experience and the results of this experience are shown in the successive improvements made in some heaters by the progressive manufacturers. But the mass of the furnace trade may be assumed to pass through less careful, less skillful hands, and in the deal and shuffle the prestige of the "Ichabod No. 80," the salvation of the corporal of industry who sells it, and the reputation of the manufacturer are in danger.

How are we to remedy this state of anarchy and meet the condition squarely? Coming down to fixed principles it would seem that consolidation of interests would provide for the economical inauguration of systematic reform, as well as for the economical administration of affairs. The furnishing of uniform patterns at small cost to individual manufacturers would be of immense advantage. The ideal furnace should be uniform and interchangeable in its parts; and, like the telephone, for instance, it should be distributed to agents from a central point. Or, duplicate iron patterns could be awarded to those entitled to use them.

The Ideal furnace of the twentieth century should be practically a new creation, one avoiding the joints between the combustion and air chambers, and so complete in its details that the heating surface for each room may be determined separately, and allotted and operated with the same exactness, as are the radiators of direct and indirect steam and hot water installations.

It should also operate separate air circuits to and through every room. Being the logical air mover the exhaust taking the cold air from each room is, from every point of view, economical. It saves the fuel otherwise wasted in the endeavor to force air into a space already full of air. It also saves the furnace from damage by

overheating in making said fruitless endeavor. Who would undertake to heat water in a circulating boiler, using only a single pipe between water back and boiler? It is only the elasticity of air which allows the furnace to perform any duty whatever under ordinary circumstances.

The Late Edward N. Currier.

At a special meeting of the Furnace Dealers' Association of Cleveland, Ohio, and former business associates of the late Edward N. Currier of the City Stove Repair Association of Cleveland, held in that city on Saturday, June 21, the following resolutions were adopted:

Whereas, Our dear brother and business associate, Edward Currier, has been called away in a manner peculiarly sad; and

Whereas, The suddenness of his death deprived his many friends who loved him of the melancholy comfort of having been at his side to wish him godspeed upon his last journey and to help by word and presence to make his end less bitter; therefore, be it

Resolved, That the Vulcan Club, of which Edward Currier was an honored member, while realizing the futility of human demonstrations in the presence of the awful shadow, offer to the widow and orphans of the man they knew well and loved better such poor consolation as can be wrung from sorrowing hearts, and extend to them the comfort and assistance which man owes his fellow creature. Edward Currier left to his family the precious heritage of a stainless name. The Vulcan Club cannot recall him to life, but it can emphasize the fact that he was a man among men whose heart was large and whose memory will be honored while it lasts. To his family we say, this memory is priceless; when the bitterest anguish is over you will, perhaps, be consoled with the thought that the good man whose end came too soon left his mark upon the hearts and minds of all who knew him.

Signed by the committee of the Vulcan Club.

C. R. HOLMES, president.

WILLIAM H. DETTELBAUGH, treasurer.

EDWARD BOHM, secretary.

Wood Furnaces.

The recent rapid advance in the price of coal has served to turn attention to other forms of fuel for household use and to lend added interest to heating furnaces adapted for burning wood. In a catalogue which is being sent out by the Wood & Bishop Company, 329 Main street, Bangor, Maine, some very interesting information is presented as to the merits of wood furnaces for heating buildings of all kinds.

The Monitor is offered by the company in both portable form and adapted for brick work. It has a heavy all cast iron fire box, a large dome united to the top of the body in a deep cup joint and radiator connected to the dome by a draw joint fastened by upright rods. The body of the heater is corrugated and is in one piece. There is no grate, as the wood burns on the ashes with the draft on the fire line. The radiating surface is large, both sides of the radiator being directly exposed to the fire and to the cold air entering at the bottom. The company also make a hot blast furnace in portable form and for brick setting, it being offered in three sizes. The radiator is made of heavy plate steel, with heavy cast iron heads. The body of the heater and the fire box are the same as in the Monitor.

The manufacturers make the point that there are several marked advantages in a wood furnace, as any one can take care of the fire without special experience, and that a dwelling, a hall or a church can be heated completely in less time than is the case with a coal fire. They also point out that people who have had experience with wood fires maintain that the heat from them is milder, softer and more healthful than where coal is used, while at the same time the question of gas is wholly eliminated. The catalogue which the company have issued contains suggestions regarding location of furnace, sizes of pipes and registers and directions for operating their wood furnaces. A long list of names of purchasers of their goods is also given, these being arranged by cities and towns and indicating the number which each concern or individual has purchased.

THE BORN STEEL RANGE COMPANY, Cleveland, Ohio, have purchased a parcel of ground adjoining their present works, and will erect on it a one-story building, 500 x 120 feet.

ODD PLATES.

WRITING from Nottingham, England, United States Consul C. McFarland says that while the demand in the United Kingdom for American Oil and Gas Stoves and Coal Ranges is growing gradually, it could be doubled or quadrupled if our exporters would only study and conform to the peculiarities of the British market.

THE BERGSTROM SONS & Co., Neenah, Wis., have discovered a very unique and patriotic way of advertising their Royal Stoves and Ranges. They are favoring the trade with a number of blotters, artistically embossed with patriotic designs, among them being the Liberty Bell, "Old Glory" and fire crackers galore.

W. H. GRUENHAGEN, jobber and representative of various leading Stove and Range manufacturers, has just completed the erection of a new warehouse at St. Anthony Park, Minn. It is one of the largest warehouses in the Northwest devoted to the Stove trade, and enables Mr. Gruenhagen to carry a large and varied stock of Stoves and Ranges. The building is 52 x 100 feet in size, with three stories and basement, giving over 55,000 square feet of storage space. The facilities for receiving and shipping goods are exceptionally good.

"SWEEP THE CORWEBS OUT OF YOUR BRAIN" is inscribed above a little broom attached to a card which W. H. Colebrook's Sons & Co., Syracuse, N. Y., are sending out in the interest of the Crown Asbestos Furnace Cement. The house manufacture a variety of articles of interest and use to Stove and Furnace men, and desire to have their literature before the trade.

THE ELKHART STEEL RANGE & FOUNDRY COMPANY is the name of a concern recently organized at Elkhart, Ind., for the purpose of making a form of Steel Range designed by F. B. Van Camp. The incorporators of the company are F. B. Van Camp, F. M. Miller, Strafford Maxon, W. G. Forward and Howard Grey.

THE ESTATE OF P. B. BECKWITH, Dowagiac, Mich., proprietors of the Round Oak Stove Works, begin in this issue of the paper a series of drawings illustrating the life of the now famous Indian chief, Doe-Wah-Jack, after whom was named what is now a most thriving center of industry. The series of drawings will illustrate his boyhood, his home, his ancestors, his youth, his games, contests and diversions, his maturity distinction and honors as chief. The announcement is made that he is now a good Stove salesman and wears store clothes.

UZAL CORY & Co., 210 Water street, New York, are sending out a little pamphlet in the interest of the Cory Improved Excelsior Hot Air Furnaces, with the alliterative title: "Healthy, Happy Homes Have Cory's Hot Air Heaters." These heaters have been on the market for many years and have fully demonstrated their excellence. They are used for heating many of the finest residences in the vicinity of New York, and their prestige has been the means of introducing them in other sections of the country, where they are held in high esteem.

THE BRIEN HEATER COMPANY, Hoosick Falls, N. Y., who are now enjoying the possession of a new and much enlarged plant, have in course of completion a new catalogue, soon to be issued, devoted to the Brien Heaters. These Heaters are adapted for both hard and soft coal, and the new catalogue will show some substantial improvements which are designed to increase their efficiency. These Hot Air Furnaces have now been upon the market for several years, and have brought a steadily increasing demand to the company.

THE SIFTER STOVE POLISH COMPANY, Saginaw, Mich., have been organized with a capital of \$100,000 and the following officers: J. S. Smart, president; L. C. Slade, vice-president, and Eugene McSweeney, secretary and treasurer. F. A. Smart is general manager. The company will put on the market a Stove Polish made from the pure graphite, the product of the United States Graphite Company. The Stove Polish will be marketed in a new and what will be, it is thought, a very popular manner, the polish being powdered and put in a sifter top box, so that it can be applied with very little labor and annoyance.

UNDER date of July 1 the Liberty Stove Company, successors to Charles Noble & Co., announce that they have removed their offices to 114 North Second street, Philadelphia, where a display will be made of the Liberty and Iron King Stoves, Ranges and Furnaces.

A Rack for Washers.

A rack for holding Leather Washers of different varieties and sizes is shown in the accompanying illustration. It consists of a piece of varnished pine board

A Rack for Washers.

into which round iron rods are stuck, as shown. Over these are placed the Washers. This rack is securely fastened to the wall and serves not only as a good means of keeping this line, but also of displaying it.

The Automatic Oiler.

The Rochester Automatic Oiler & Supply Company, 206 Mill street, Rochester, N. Y., are offering the automatic oiler herewith illustrated. It is made of No. 20 gauge cold rolled Swedish steel, copperized, and holds a fraction less than 1/2 pint of oil. When filling the can the spout is depressed, as shown in the cut, forcing the air out and causing a vacuum. The end of the spout, while thus depressed, is inserted in oil and the

The Automatic Oiler.

oil is at once forced into the can, taking the place of the air ejected. It is remarked that it is impossible to overfill the can; therefore there is no waste of oil and no greasy oller. When oil is required it is obtained by pressing the spring bottom, or if a quantity is desired the spout is depressed, forcing out a stream to a distance of 4 to 6 feet, it is explained, depending on the force used. The point is made that nothing can go into the oiler except through the spout, the smallest part of the oiler; that there can be no stopping of the spout, as flies, shavings and lint cannot be taken in, and that whatever goes in must come out, as the pressure of the button forces it out.

The T. & B. Fruit Jar Holder.

The Tarbox & Bogart Mfg. Company, Cleveland, Ohio, are putting on the market the fruit jar holder shown herewith. The band which encircles the jar is a $\frac{3}{4}$ -inch crucible steel ribbon, specially rolled to exactness in gauge, and its flexibility allows it to conform to the jar. To this band is riveted a symmetrically formed forked handle, the attachments being made at points opposite the diameter of the quart, or medium sized, jar, so that, when the wrenching movement occurs, instead of an impact, it is explained, there is a tangent action, not a crushing action. The locking device is comprised

Fig. 1.—The T. & B. Fruit Jar Holder.

in a draw bar which intersects with a series of perforations in the loose end of the encircling band, and is operated by acting in an eccentric latch, pivoted to the handle, sufficiently back of the point of contact with the jar to apply no direct pressure upon the jar. It is pointed out that the cam of the latch can be so timed in relation to the center of action as to give a dead center, making it self locking. To add elasticity to the flexibility of the band, and to increase the friction, a rubber cushion is inserted in an offset of the band between the forks of the handle. It is remarked that the compression upon the jar being evenly distributed, and so gently

Fig. 2.—Fruit Jar Holder in Use.

applied, makes it, theoretically, impossible to crush the shell. The holder may be applied to form a handle to circular receptacles of various sizes, such as glass bowls, tin cans, paint pots, &c., so that when the jar is hot it may be handled as a pitcher. It is stated that in opening jars there is no disturbance to mix the musty scum with the fruit, as the jar need not be tilted nor shaken. The holder is designed to retail at 15 cents.

Never-Rust Compound.

George Borgfeldt & Co., 48-50 West Fourth street, New York, have put on the market a high grade rust preventive, the trade name of which is "Never-Rust." This material is really a slushing compound, the valuable characteristics of which, according to the manufacturers, are that it never gums, gets rancid or hard; contains no acid; is always odorless and easily applied. It is made in six grades, three of liquid and three of paste, varying in density through gradations of light, medium and heavy, in both forms, so as to meet many diverse requirements. In the mass it is of an orange tint, but applied to bright metal is almost transparent. It can be put on with a brush or cloth, and easily removed after it has performed its mission without any cutting agents, as is required for the removal of white lead and tallow or similar compounds, leaving the surface in its original

condition even after long exposure to the elements. A coat of Never-Rust is said to be more effective than a thick coat of grease, petroleum or tallow combination; always leaves the steel bright; dampness has no effect on it, and the sun does not remove it. The claim is made of greater economy, because of the larger surface covered effectively, the thin coating also catching and holding less dust and grit than a larger volume of material. It is put up in barrels of about 360 pounds; half barrels, 200 pounds, and cans holding variously 50, 25, 10 and 5 pounds. Samples will be mailed gratuitously for the asking, no charge being made for packing when regularly ordered in commercial quantities.

Lisk's New Oval Dinner Pail.

We present herewith illustrations showing the new oval dinner pail that is being manufactured by the Lisk Mfg. Company, Limited, Canandaigua, N. Y. This dinner pail is made of the best quality charcoal tin plate in

Lisk's New Oval Dinner Pail.—Fig. 1.—View of Pail, Closed.

three sizes—4, 5 and 6 quarts. The trays, the cover and the cup are all seamless, and consequently are not liable to leakage. The body, trays and cover are heavily wired, making them unusually strong and able to withstand hard service. The ears are firmly fastened to the body and the bail handle is strong and durable. We

Fig. 2.—Parts of Dinner Pail.

are advised by the manufacturer that this pail is meeting with a large and steadily increasing sale. It is regarded as the most complete and up to date utensil of its kind on the market.

U. T. Hungerford Brass & Copper Company.

U. T. Hungerford Brass & Copper Company, 121 Worth street, New York, owing to encroachments by the Rapid Transit Commission, who are about to locate a subway station on a portion of the property at the above address, and the increasing demands of their business, have been compelled to seek larger quarters. They are now about to move into a fine large building about completed, known as the Hallenbeck Building, at the corner of Pearl and Park streets, 100 feet east of Centre street, a ten-story building covering a site nearly 100 feet square. The company occupy the basement, street floor and first floor above the street. There is also a new

building now under way adjoining this structure, facing Park street, of which they will have the first three corresponding floors, giving them a total of about 30,000 square feet of floor space.

In the basement of the Hallenbeck Building, which is finely lighted from natural as well as artificial sources, they will carry heavy case goods, ammunition and all reserve stock in boxes. The street floor has been systematically arranged to carry, in a comprehensive way, immense stocks of staple brass, copper and kindred goods. In one large room will be an adequate stock of rivets and burs, sheet brass and brass and copper wire in bundles, the shelving being of North Carolina pine. One large rack has been constructed to hold about 100,000 pounds of brass and copper rods. The rack for brazed tubing has a capacity of about 50,000 pounds. The rack for seamless brass and copper tubing includes also brass, tinned and nickel plated tubing in iron pipe sizes, with another rack to carry 50,000 pounds of seamless copper tubing for coppersmith use, with overhead facilities for carrying copper tubing for the same class of trade, in lengths of 20 feet, which are extra long.

The upper of the three floors is being fitted up for office and counting room purposes. Here also will be located their sample and show rooms. They have ample elevator service, both passenger and freight, and the various modern conveniences now only possessed by up to date business structures.

Their largely increased facilities, close proximity to the business centers and shipping accommodations make possible the carrying of even greater stocks than heretofore and the prompt shipping of orders.

The Herrick O. K. Wire Hoops.

The wire hoops shown in the accompanying cuts are offered by the F. A. Herrick Company, Jackson, Mich. They are designed for use on tubs, pails and barrels.

The Herrick O. K. Wire Hoops.

The hoops are made of galvanized wire with a galvanized clip, so as not to rust, and are referred to as outlasting two or three common iron hoops. The wire hoops are sent from the factory with one end of the wire in the clip, as shown, and a hammer is the only tool required to put them on. They are packed in neat boxes ready to retail from, in lengths suitable for pails, tubs and barrels, one size in a box.

Stove and Hardware Dealers.

THE eighth annual picnic of the Chicago Retail Hardware Association is announced by Fred. Ruhling, secretary of the Picnic Committee, and will be held on Wednesday, July 16, at Palos Park. There will be a number of contests for prizes and it is proposed to have all dealers connected with the association close their stores on the eventful day. Palos Park is a delightful spot of rolling country, covered with a rich growth of grass. Swings, bowling alleys and other accessories will contribute to the enjoyment of those in attendance. All jobbers donating prizes for the different contests are to be favored with an advertisement in the programme.

GEO. W. ARTHUR, in the Hardware, Mill Supply, Farming Implement and Buggy and Wagon business in

St. Matthews, S. C., desires catalogues, price-lists, &c., relating to Light Hardware, Sporting Goods, Plumbing Supplies and House Furnishing Goods.

THE AMERICAN WASHBOARD COMPANY, Cleveland, Ohio, are putting on the market No. 177 White Swan Enamel, also No. 178 Blue Jay Enamel Washboards. It is stated that the No. 177 is the only White Enamel Washboard on the market. The Glass Washboards which the company manufacture are referred to as having a large sale, while the Enamel Boards also are in good demand.

D. H. BURRELL & Co., Little Falls, N. Y., beginning February 1, 1903, will offer to the trade an improved Cream Separator, based on an important invention of which they obtained control some years ago, but which they were unable to put on the market on account of some other patents which stood in the way, but are about to expire. This Cream Separator, which will be known as the Simplex Link Blade Separator, is referred to as a distinctive advance in this line of industry.

THE ALUMINUM COOKING UTENSIL COMPANY, Pittsburgh, Pa., advise us that their Ideal Percolating Coffee Pot, which was illustrated in a recent issue of this paper, is proving very popular. For the past two months the company have been unable to fill one-half the orders that have been coming to them for this utensil.

THE SIMMONS HARDWARE COMPANY, St. Louis, Mo., have completed arrangements for the opening of a warehouse and supply depot at Ogden, Utah, where they have purchased property for this purpose.

Prof. J. B. Johnson.

Prof. John B. Johnson, dean of the College of Engineering of the University of Wisconsin, at Madison, Wis., was accidentally killed on June 24, by being thrown from his carriage at his summer home, at Pier Cove, Mich. He was born in Marlboro, Ohio, in 1851, and was graduated from the University of Michigan in 1878. Three years later he was called to the chair of civil engineering in Washington University, St. Louis, Mo. After a service of 18 years in that position he was appointed dean of the engineering department of the University of Wisconsin, which office he filled at the time of his death. Professor Johnson originated the Summer School for Artisans in connection with the University of Wisconsin, reference to which has been made in these columns. He was remarkably successful in building up the engineering department of the university named, and was instrumental in securing the erection of a \$100,000 engineering building, equipped with apparatus costing \$40,000. Professor Johnson was considered one of the foremost authorities on engineering in the United States, and was the author of a number of standard books, many of which are in use as text books.

Substitute for Linseed Oil.

The discovery of such immense deposits of oil in the Beaumont district of Texas has stimulated the use of oil in some new fields. It has proved its efficiency as a substitute for coal and other fuels; it has also been used for the sprinkling of streets, country roads and railroads, and its susceptibility to refinement into excellent illuminating and lubricating oil is manifested by the success of experiments at the Guffey refinery at Beaumont. Moreover, it has been proved that an excellent substitute for rubber can be manufactured from the residuum. According to the New York *Commercial* a company have now been organized, with a capital of \$100,000, for the manufacture of a colorless substitute for linseed oil. It is claimed that experiments conducted for several months at Dallas, Texas, have demonstrated that this oil can be purchased at such a low cost as will cause it to be largely substituted for linseed oil as a mixing agent for paints and in many other of the commercial uses of linseed oil. The claim is made that the oil is perfectly clear and that it possesses all the qualities of pure linseed. A factory for the manufacture of the substitute will, it is said, be built at Beaumont.

Patterns for Elbow Mitering Against Soffit of Winding Chute.

We have an inquiry from a correspondent in Parkersburg, W. Va., asking for a method of developing the patterns for an elbow mitering against the soffit of a winding chute. Our correspondent's drawings show a plan and elevations representing each of the four sides of the article in question, a portion of which are reproduced in Fig. 1 of the accompanying diagrams, while Fig. 2 is a perspective view of the article in question. The rear and one of the side elevations are omitted in Fig. 1, for the reason that they show something not given in the other views.

The elevations being projected from the plan necessarily have their tops turned toward the same, but as the side view is in this case the one most useful in obtaining the patterns, we have so turned the drawings on the page that this view occupies an erect position. As

the points thus obtained in the front elevation will then exactly correspond with A B of the side elevation. The line thus obtained from A B would be very much different from the line $A^2 B^2$ already drawn in the front elevation, as will presently be shown. While only one view, when finally corrected, is necessary in obtaining the pattern, the above operation will greatly assist in completing the design, from the fact that neither elevation will in the present case present such outlines as will be apparent to the eye in the finished article. For instance, if any point, as a , be assumed upon the inner curve of the plan somewhere near the 18 x 18 inch opening and lines be projected therefrom into both the elevations, as shown dotted in Fig. 1, it will be discovered that the intersection with A B of the side elevation at a' is much nearer the top line or point b than is the intersection a'' of the front elevation as drawn, the difference being there shown by $a' a''$. This is because the sides of that portion of the chute near the 18-inch opening are very oblique to the plane of the side view, and therefore do not present the outlines of the soffit as they really are;

Fig. 1.—Reproduction of Our Correspondent's Drawing.

our correspondent notes that the miter lines of the elevations (meaning, no doubt, the lines defining the lower curved surface or soffit) are not correctly projected, we presume that his difficulty, as in the case of many others, is primarily that of making a correct drawing of the subject. This is also apparent from the manner in which he shows in dotted lines upon the plan the position of an elbow which is to miter into the soffit, and which he notes in a few words written on his drawing is to occupy the position shown in the side elevation.

As the operation of projecting correctly the several elevations from the plan and one given elevation is of prime importance in the solution of many problems, we give briefly the method by which the several elevations may be made to correspond in every particular. If the curve A B of the side elevation in Fig. 1 be accepted as correct, it must first be divided into convenient spaces and lines from the several points of divisions dropped vertically upon the corresponding line $A^1 B^1$ of the plan. If a front elevation is desired, lines must now be carried from the several points on $A^1 B^1$ toward the front of the plan indefinitely—that is, at right angles to the first set of lines drawn—upon which the heights of the several points on A B must be set off from any horizontal line, as the line of the top. A line traced through

Fig. 2.—Perspective View of Article Shown in Fig. 1.

PATTERNS FOR ELBOW MITERING AGAINST SOFFIT OF WINDING CHUTE.

in other words, the point a' is much further back of A than it appears, while those portions of the curve nearer the larger 6-foot opening are more correctly shown in the side view, and for the same reason would, if correctly drawn, be correspondingly distorted in the front view. It then becomes apparent that the outline in one or the other, or perhaps in both views, is wrong, and that as a matter either of design or of utility, as the case may be, the view from which the patterns are to be obtained, in this case the side view, should be so corrected as to produce the desired result. That is, if a line drawn through points A^2 and a' of the front elevation (not shown) be considered as having the proper pitch or slant, then the line from A to B, passing through a' of side elevation, may be assumed as correct; but if such pitch, when shown in the front view, be not deemed sufficient, then a point somewhere below a' of the elevations, as c or a'' , must be assumed and the curve A B so drawn as to pass through it.

To assist the reader in forming a correct idea of the figure under consideration we show in Fig. 2 a perspective view of the same as it would appear if made approximately from the plan and side elevation shown in Fig. 1, from which the inclination of the soffit at all parts of its course may be seen.

Before the operations of pattern development can be begun one other matter must be determined—viz., the exact nature of the soffit or curved surface forming the bottom (and in its lower part the back) of the chute. This surface, as shown in plan by $A^1 B^1 D C^1$ and in the side elevation by A B C, is similar to the soffit of an arch in a circular wall. In Problems 214 to 217, inclusive, of the "New Metal Worker Pattern Book" surfaces of this character are treated, from which the reader may derive much benefit by comparison of methods. In the treatment of this surface, in view of subsequent operations, the pattern cutter, as in many other instances, is called upon to choose between the method which adheres strictly to the drawings as given

him, and thereby leads him into intricate complications, and a course which is very much simpler and more practicable, though not following out the design to the letter. Since it is against this surface that the elbow, partially outlined in Fig. 1, is required to miter, and since the pattern for such a surface can only be developed by triangulation, it will be seen that the several triangles into which its surface is divided by the operation of obtaining its pattern are all small planes, each slanting at a different angle, and that to obtain with accuracy the intersections of the different pieces of the elbow with the several triangular planes which may lie in the path or course of each would involve much labor. There is no limit to the intersections which it is possible to obtain if necessary, so long as the surfaces or figures involved and their relative positions can be geometrically defined. Such operations would no doubt be more interesting and instructive than practicable. In view, then, of the above mentioned conditions, so far as ob-

out of the same, beginning at A^1 , is set off on $C^1 A^1$ of the plan, extended as shown by $A^1 E$. Lines from the several points on $A B$ are then carried upward to intersect with the outlines of the sides $A^1 B^1$ and $C^1 D$ of the plan, from which points of intersection lines are carried into the measuring lines of corresponding number of the stretchout in the usual manner. Then will $A^1 B^2 D^2 C^1$ be the pattern of a soffit, of which $C A B$ is the profile. That portion of the pattern corresponding to $C A$ of the profile, being horizontal, is obviously the same as $C^1 A^1 c$ of the plan itself, to which the remaining portion corresponding to $A B$ of the profile, is added, as above described. The intersections are not numbered on the sides of the plan to avoid confusion with another set of numbers on each, which will be used in obtaining the patterns of the sides.

If, however, it is desirable, as before described, to adopt the line $C B$ as drawn in Fig. 4 as the further outline of the soffit, the pattern must be obtained by

Fig. 3.—Method of Developing the Patterns for the Sides and the Soffit of Chute; Two Methods of Treating the Soffit Being Shown.

PATTERNS FOR ELBOW MITERING AGAINST SOFFIT OF WINDING CHUTE.

taining the patterns is concerned, the intersection of the elbow can be greatly simplified by considering the soffit as a portion of a somewhat cylindrical surface, whose profile is $A B$ of the side view, Fig. 1, thus doing away with the line $C B$. At all events, if a single line be used from B to a point above where the 10-inch elbow enters, the further outline may then be allowed to deviate to the point C , as shown in Fig. 4, if it is desirable to adhere to the original character of the design as given in the side view of Fig. 1. This arrangement reduces the intersection of the elbow with the curved soffit, shown in detail in Fig. 5, to a problem in miter cutting so simple as to scarcely require demonstration; and if, as above mentioned, the single line $A B$ be adopted as the profile of the soffit, the same may be said of the remainder of the work.

The method of obtaining the pattern of the soffit upon this supposition is shown upon the plan of Fig. 3. Since that portion of the pattern corresponding to $C A$ of the profile, which is horizontal, must be the same as shown in the plan, the remaining portion of the profile $A B$ is divided into any convenient number of equal spaces, as shown by the figures 1 to 7 at the right, and a stretch-

triangulation. As its sides must correspond in length, respectively, with the lower edges of the two side pieces of the chute, it will be most convenient to develop the patterns for the side pieces first.

Therefore divide $A^1 F$ of Fig. 3, the plan of the inner side, into any convenient number of equal spaces, as shown by the small figures 1 to 8, and set off a stretchout of the same on the top line of the elevation, extended as shown by $M N$, and draw the usual measuring lines. From the several points on $A^1 F$ drop lines, cutting the line $A B$ of the side, as shown by the small figures on the left of $A B$, and from the several points of intersection carry lines horizontally, cutting measuring lines of corresponding numbers, and trace a line through the several intersections, as shown by $P Q R$. Then will $P Q R N M$ be the pattern for the inner side. It will be noted that a line from point B of the side must be projected onto the plan, where it is designated as 6. It must then be correspondingly located on $M N$, so as to determine the position of point Q of the pattern. The pattern for the outer side is obtained in exactly the same manner by dividing its profile or plan $C^1 G$ into spaces, which are set off on the line $S T$ for a stretchout. Lines

from the points on $C' G$ are then dropped into the line $C B$ of the side view and are then carried thence into the measuring lines, all as shown at the left in Fig. 3. The line $C A B$ may be used instead of $C B$ if the mitered pattern above obtained is to be used. The reader is referred to Problem 48 of the "New Metal Worker Pattern Book," in which a subject of similar nature is treated.

The triangulation of the soffit piece is shown in Fig. 4, but the pattern as obtained therefrom is shown in the upper part of Fig. 2 at the left. Since from the nature of the design there is no view in which the full length of its sides can be given, any method of dividing them into spaces may be adopted which is most convenient. The line $A B$ of Fig. 4 is therefore first divided by the points j, i, h and g into equal spaces down to the point g , which corresponds with the point 4 of the first division

Fig. 4.—Method of Triangulating the Soffit of Chute Preparatory to Obtaining Pattern.

drawn through the shorter diagonal of each, as $e g, d h$, &c. In determining the true lengths of the sides of the several triangles into which the plan of the soffit has thus been divided it will be seen that the lengths of the solid lines and of the dotted line $C' l$ may be taken directly from the plan as given, because they represent the horizontal lines of the side view, but that the true length of the dotted lines must be obtained by constructing a diagram of triangles, as shown below in Fig. 4. Therefore from each of the various points g, h, i , &c., on the line $A B$ draw a horizontal line to a point directly below the next higher point on the line $C B$, from which drop a perpendicular. Then will the several perpendiculars $g' e, h' d$, &c., be the altitudes of the right angled triangles of the diagram, of which the dotted lines will be the bases.

In constructing the diagram of triangles the several heights $X a, X b, X c$, &c., are made equal to $k' a, j' b, i c$, &c., of the side elevation, while the bases $X k, X j, X i$ are made equal to the dotted lines $a k, b j, c i$, &c., of the plan. The several hypotenuses $a k, b j, c i$, &c., of the diagram will then be the true lengths of the dotted lines of corresponding letters in the plan.

In order to find the true lengths of the spaces $a b, b c$, &c., of the outer side and $l k, k i$, &c., of the inner side it will be necessary to find points exactly corresponding to them on the outlines, or miters, $U V$ and $P Q$ of the patterns of the side pieces previously ob-

Fig. 5.—Patterns for the Several Pieces of the Elbow Mitering Against Soffit of Chute.

PATTERNS FOR ELBOW MITERING AGAINST SOFFIT OF WINDING CHUTE.

of $A B$, Fig. 3, used in obtaining the first or mitered pattern of soffit, and which also represents the point of deviation between the line of the inner side $B A$ of the soffit and that of the outer side $B C$. On account of the coincidence of the two lines from B up to this point it is evident that the two patterns must be alike for the same distance, therefore in beginning the triangulated pattern first transfer a duplicate of that portion of the mitered pattern from the measuring line 4 of the stretch-out $A' E$ of Fig. 3 to the end $B' D'$ to any convenient position, as shown by $f g B' D'$ at the left.

Now erect lines from points in $A B$ of Fig. 4 to cut line $A' B'$ of plan, after which it will appear that a very long space occurs from A' to point j of the plan. This space may be further divided by points k and l , and lines from these points of division carried back to the side view and correspondingly lettered, as shown. From the several points g to l of the side view carry lines horizontally across, cutting the outer line $C B$ at points a to f , and from these points erect lines, cutting the outer line of the plan $C' D'$, as shown by corresponding letters. Connect points on the inner with those on the outer line of the plan with solid lines corresponding with those just drawn across the side view, as $f g, e h$, &c., and divide the spaces so obtained by means of dotted lines

tained in Fig. 3. Therefore from the points 1, 2, 3 and 4 as numbered on the right of $A B$ of Fig. 3, which correspond exactly with points j, i, h and g of $A B$, Fig. 4, project lines in either direction, cutting the lines $U V$ and $P Q$ of the patterns, as shown, and lettered to correspond respectively with the points on $C B$ and $A B$ of Fig. 4. Then will the spaces $g h, h i$, &c., and $f e, e d$, &c., be the correct lengths of the spaces bearing corresponding letters of the plan, Fig. 4. To complete the pattern as shown in Fig. 3, of which the portion $g f D' B'$ has already been obtained as described above, take first the distance $e f$ of the pattern of side just below and from f of pattern as center describe a small arc near e , which intersect with another arc whose center is g of the pattern and whose radius is $g e$ of the diagram of triangles in Fig. 4, thus locating the point e . In the same manner, with radii respectively equal to the spaces $g n$ of the pattern of the inner side and $e n$ of the plan in Fig. 4, describe arcs intersecting at h . So continue, using the spaces upon the pattern of the outer side piece for distances on the outer side of the pattern and those from the pattern of inside piece for distances on inner side of pattern; also lengths from plan in Fig. 4 for distances on the solid lines across the pattern and lengths from the hypotenuses of the diagram of tri-

angles for distances on the dotted lines of the pattern, all as shown. Lines traced through the intersections of arcs, as shown by $A^3 g$ and $C^3 f$, will complete the pattern. That portion of the curve from C^3 to a of the pattern may be transferred from the corresponding arc of the plan, since the surface of the soffit at that part is practically horizontal and therefore correctly shown in the plan.

The intersection of the elbow with the cylindrical surface at $B g$ of Fig. 4 is shown somewhat enlarged in Fig. 5. The elbow, as if completed, is there drawn in five pieces, but any number of pieces desired can be used. As will be seen, piece 1 is entirely eliminated by the intersection, while pieces 2, 3 and 4 miter against the surface of the soffit. The operation of developing the pattern of piece 3 is first shown as though it were an entire piece. The intersections of the miter line $A B$ with pieces 2 and 4 have been transferred to corresponding points on piece 3, as shown at $a b$ and $c d$, so that the operation of developing the patterns for the three pieces is performed at once, a half pattern of all the pieces being shown, from which the full pattern for each piece may be traced, making the joint either at the throat or at the back, as described. The stretchout is obtained from a profile of the elbow placed in line with piece 3 of the elevation, and the subsequent operations are so fully shown in Fig. 5 as to require no further demonstration.

The length of the opening in $A B$ to receive the elbow is equal to $e f$ and its stretchout may be taken from the points of intersection on $A B$ for piece 3, to which is added above that of $a b$ for piece 4 and below that of $c d$ for piece 2. The width of the opening at the several points is equal to that of the profile on lines of corresponding number.

THE ORIGIN OF "PI."

BY I. N. PHILLIPS, NASHVILLE, TENN.

One of the first questions encountered by the sheet metal worker who is trying to improve himself in the higher branches of his trade is how to calculate the circumference of a circle from its diameter. In these latter days there is no trouble in procuring a printed table of circumferences and areas of circles, and I think that it is well to keep one of these tables at hand to save time and to reduce the chances of mistakes, for the best of us are liable to slip a cog in the hurry of business. At the same time it is well to understand the principles underlying the calculations on which such tables are based.

The first rule that the workman generally learns is to "multiply the diameter by three, and add one-seventh of the diameter to the product." While this rule is not absolutely correct, it is accepted by many as near enough for all practical purposes. As he proceeds in his search, the workman finds this rule: "Multiply the diameter by 3.1416, and the product is the circumference," and he will generally accept it with the beautiful faith of a new convert, because he saw it in a book, and it looks and sounds scientific. But if he should be asked why he multiplies by 3.1416 rather than 3.1614, he will probably be stumped. The decimal 3.1416 is the ratio of the circumference to the diameter, and is denominated by the books and mathematicians by the Greek letter "Pi." It was not stumbled upon in the dark, nor obtained by any cut and dried method. It has been known since the days of Euclid, and probably longer, and was given the name of "Pi" by a Swiss mathematician named Leonhard Euler, who lived from 1707 to 1783. So it is quite ancient. It is nearly the same ratio as 7 to 22, a closer approximation being 113 to 355. It is easily deduced by any diameter multiplied by any circumference, and the product divided by its diameter will give the circumference of the first diameter. Hence, if the circumference of 7 is 22, any diameter multiplied by 22 and the product divided by 7 will give the circumference of such diameter.

In looking up the origin of "Pi," it will be found by the following method: Geometry treats a circle as a polygon with an infinite number of sides, and if the student will take a polygon of six sides, called a hexagon, and from any standard work familiarize himself with

the method of calculating the perimeter of the six sides, and then divide it into one of 12, 24, 48 sides, &c., he will find in the eighth and ninth operation that the results begin to differ at the sixth place of decimals—that is, 3.141591 and 3.141592. Now as four places of decimals is by common consent generally considered close enough, the decimal 3.1416 is used.

If the student has followed up the operation as indicated, he has had some healthy practice and probably has some respect for "Pi." If he chooses, however, he can carry on the calculation, *ad libitum*, with the assurance that he will not find the exact ratio. He will only approach a little nearer the unattainable, and, after he has figured until he is tired, if he is of a reflective turn of mind it will begin to dawn on him that the man who is trying to square a circle by mathematics is barking on a cold trail, because he is like the fellow who tried to move the world with a lever—he had no place to rest his lever.

From the foregoing it will be seen that "Pi" 3.1416 (the circumference of one) is only a very close approximation; near enough, but not exact. Now, why there is not an absolutely correct ratio between the diameter and the circumference is another story. At any rate, the above may be of some help to the mechanic who has begun to inquire into the reasons for things.

A Gang Slitting Machine with Flattening Rolls and Winder.

To meet the demand for a gang slitting machine so arranged that the slitted metal shall leave the machine with each strip coiled separately and without any burr

Gang Slitting Machine with Flattening Rolls and Winder.

on the edges, Blake & Johnson of Waterbury, Conn., have designed the machine here illustrated. It is provided with a pair of hardened steel rolls, placed directly behind the cutting arbors, for rolling down the burrs. Behind the rolls is a winder shaft, which may be driven by an intermediate shaft and bevel gears, or by a belt from the main cutter arbor. The arbors are of hammered steel 2 inches in diameter, and in their ends are inserted hardened steel thrust bearings which run against the ends of hardened steel screws. The frame supporting the outer ends of the arbors is adjustable on the bed, and by loosening the clamp screws can be moved on the bed to allow the cutter to be removed or changed without disturbing the arbors. The cutters are $4\frac{1}{2}$ inches in diameter. The machine will take a sheet 7 inches wide and of any thickness up to No. 17 Stubs gauge.

The offices of the United States Fire Proofing Company have been removed to the Keystone Building, Fourth avenue, Pittsburgh, Pa.

THE TIN PLATE WAGE SCALE.

The Conference Committee of the Amalgamated Association of Iron, Steel and Tin Workers met in New York City on Tuesday and Wednesday of this week with Vice-President Warner Leeds and the district managers of the American Tin Plate Company for the purpose of considering the seven new foot notes proposed by the association. President Shaffer and the other members of the Amalgamated Conference Committee returned to Pittsburgh on Wednesday evening. Before leaving Mr. Shaffer said:

We settled nearly all the foot notes, as the general conditions are called. The rest have been referred to the local lodges. Our conferences have been friendly and satisfactory, and there has been no friction. The foot notes, most of which have been settled, do not affect the general situation. There is not, will not be and cannot be any trouble until the wage scale expires on July 1, 1903.

Metal Shingles and Tiles.

The Montross Metal Shingle Company, Camden, N. J., report a marked increase in every department of their business. They have experienced an especially active demand for their Victor, Gothic and Diamond metal tiles, and their Eastlake and Octagon metal shingles. These goods are made in both tin and galvanized iron, and are thoroughly painted on both sides with the best oil paint. The Victor shingle is designed for buildings where a special ornamental roof is desired at a moderate cost, while the Eastlake shingles are adapted for all classes of buildings, and cost about the same as the ordinary wood shingle, or slate, or tin roofing. The company are also placing on the market the Eastlake roofing paint, made in four colors—red, brown, black and slate. This paint is especially prepared for metal shingles, tin and iron roofs, smoke stacks, and all metal surfaces that are exposed to the weather. Upon request the company will gladly send their catalogue, giving testimonials and illustrations of residences and other buildings covered with their various designs of metal shingles and tiles, Japanese hip caps, finials, &c.

The Totten Aluminum Soldering Compound.

Various alloys and compounds for soldering aluminum have been put upon the market with more or less success. The Totten compound is offered by the Whaley-Totten Company, 940 Ellicott square, Buffalo, N. Y., as a practical aluminum solder. It is claimed that this solder can be used with the same simplicity as the ordinary tinsmiths' solder, the observance of only a few things being necessary to secure success. The compound is said to contain a sufficient proportion of aluminum to prevent its discoloration, so that it does not present any difference in appearance from the metal of the articles on which it is used. It will join all the alloys of aluminum as well as pure aluminum, and will also solder aluminum to iron, copper, brass and malleable iron, as well as any of these materials together.

In use it is only necessary to provide a clean surface when soldering aluminum, as the compound carries sufficient flux to secure a connection with the parts to be united. It is best to provide a large soldering copper especially for this work, which, after being forged to suitable shape and filed, should be coated with the compound in the same way that the tinsmith tins his copper. The soldering copper used for the Totten compounds should not be used with ordinary tinsmiths' solder, but should be reserved for aluminum work only. Owing to the excessive heat conductivity of aluminum the soldering coppers should be heated to a greater proportionate degree and to an extent adapted to the thickness of the aluminum to be soldered. As a usual thing a cherry red heat will secure the best results, but experience will soon determine what heat will be the most effective under varying requirements. When soldering

aluminum no flux is required, nor is any scratching necessary, as it is claimed that the solder carries with it a sufficient flux to get under the oxide and make the solder adhere strongly to the surface of the aluminum. The claim is further made that an aluminum article soldered with the Totten compound will show no tarnishing or oxidization at the point of soldering, and the soldered parts will not be affected by moisture, acids or the action of boiling water.

The manufacturers state that this compound is the only one that will take thoroughly on steel or malleable iron, when a flux of muriatic acid, cut with zinc, is recommended. The flux, however, is only necessary on other metals than aluminum. The company issue a circular explaining the properties and merits of the Totten soldering compound and containing testimonials from those who have used it.

The Everlasting Chimney Cap.

Many persons desire a more substantial chimney cap than the galvanized sheet iron device generally used. The Everlasting cast iron chimney cap and base piece, manufactured by McCahan & Co., 4 North Eden street, Baltimore, Md., an illustration of which is given herewith, is claimed to supply this need in a cheap and sub-

The Everlasting Chimney Cap.

stantial manner. The device can be used as the base for any kind of round chimney cap, or it is a complete cap in itself, about 15 inches high. When used as a base on which to place a sheet metal cap, it is only necessary to take off the top or cover, which can be used for the top of the extension. The manufacturers claim that after 15 years' experience in the making of chimney caps, they believe that in this device they have secured the most effective cap yet produced. Nearly all cast iron caps heretofore used have in them obstructions of various kinds, such as cross bars, ventilators, &c., but this cap is entirely clear. The three holes in the collar at which the straps of the top are fastened are utilized when an extension is added, by driving eight-penny nails into them to hold the extension. These chimney caps are made in two sizes, with plates 22 inches square and 8½ inches at the collar, and 18 inches square and 8½ inches at the collar.

A DRAWING CLASS has been formed by the sheet metal workers of Milwaukee, Wis., for the purpose of making a more careful study of difficult sheet metal pattern drawing and of assisting those interested in this branch of trade. The class is composed of Henry Johnson, Adolph Schumann, Albrayh Milbrath, Anton Drasl, Ernst Strassberger, Rudolf Ziehn, Roland Roden, George Deitz and John Kempster. We congratulate these craftsmen on their enterprise and feel that they will be more than repaid for the effort expended.

Twentieth Century Down Draft Fire Pot.

We give herewith an illustration of the Twentieth Century down draft fire pot, which has been patented and is being manufactured by P. H. Bayley of Sidney, Ohio. The body is made of No. 26 gauge Wood's refined iron, and is lined on the inside with No. 22 gauge iron. It is equipped at the bottom with a slide for the removal of the ashes, which is only required to be done every two days. Another slide in the front is designed to close the holes for irons at night, and when carrying the pot about. On the back part are two rings with a socket at the bottom of the pot which holds the solder-

Twentieth Century Down Draft Fire Pot.

ing irons. The pot is strong and neatly finished, and is said to be especially effective with charcoal as fuel. The manufacturer claims that it provides a regular heat, while the fire is under control at all times. It is possible to regulate the heat, through the back draft and the grate, to any degree desired. It will also hold the fire over night, thus saving the trouble of building a fire in the morning. The pot is neatly made and is strong and durable. The manufacturer claims that this pot burns less than one-half as much fuel as is consumed by the old style top draft pots.

The Syphon Ventilator.

An interesting candidate for public favor in the way of a chimney ventilator is the Syphon, which is being

The Syphon Ventilator.

manufactured and placed on the market by the Syphon Ventilator Company of Topeka, Kan. The device is the invention of a prominent architect of Kansas and is constructed upon the old and well tried principle of a siphon pump. The ventilator, shown herewith, is oper-

ated by the wind, and the claim is made that the slightest breeze is sufficient for the purpose. It is strongly made of galvanized iron, all joints being both riveted and soldered. It is also strongly stayed at various points with wrought iron bands, and is mounted on ball bearings, so that it turns easily to face the wind. Some very interesting experiments have recently been made with the ventilator in connection with those of different manufacture, with entirely satisfactory results. We understand that arrangements are now in progress looking to a public exhibition of these contests in Kansas City and Chicago in the near future. The Syphon ventilator is particularly adapted for use on public and private dwellings, cars, ships, &c., as well as for the ventilation of mines, and the makers state that the device is a positive cure for a smoky chimney.

FLASHINGS.

ALL the Tin Plate and Metal houses in New York City have arranged to close up from Thursday evening, July 3, to Monday morning, July 7, thus giving a much appreciated holiday to the employees.

THE BARLOW BROTHERS COMPANY, Waterbury, Conn., have secured the contract for a large amount of Sheet Metal work on the buildings of the American Pin Company, who are large manufacturers of Air Valves.

THE INTERNATIONAL TIN PLATE CORPORATION of New Jersey, have been assigned a patent covering a system for continuous heating and metal rolling, recently granted to the inventor, Thomas V. Allis of Bridgeport, Conn.

DENNIS McNALLY, Worcester, Mass., has the contract for putting up 16,000 square feet of Metal Ceiling in the basement of St. Paul's Church in that city.

THE FRED. J. SWAINE COMPANY, St. Louis, Mo., are exceedingly busy turning out Presses, Dies, &c., in response to orders, and are crowded to the utmost of their capacity to meet the requirements of their customers promptly. The concern are adding new tools and machinery to enable them to better meet the demand for their productions, and work is rapidly progressing upon the company's new plant, the erection of which will be pushed with all speed.

GEORGE M. COUCH, Hartford, Conn., has the contract for 4000 square feet of tin roofing for a building for W. H. Shaffer. He is also building 500 Tanks, to be used on motor cycles for the American Bicycle Company.

A COMPANY have been organized at Jonesboro, Ind., with a capital stock of \$300,000, by J. M. Beavo, James L. Elston, N. J. Cappock and others, for the manufacture of Tin Plate. It is reported that an eight-mill plant will be erected. The plans are now in hand, and it is expected that bids for the construction and equipment of the plant will be called for within a short time.

THE BANFIELD plant of the American Tin Plate Company, at Irondale, Ohio, consisting of four mills, is being dismantled.

It is reported that George D. Evans, formerly manager of the Carnahan Tin Plate Company's plant at Canton, Ohio, is organizing a company to erect a large Sheet mill.

C. M. NALLS, Roanoke, Va., is contemplating the erection of a Tin Can factory in that city.

THE ENAMEL STEEL TILE COMPANY, Bellaire, Ohio, have incorporated with a paid in capital stock of \$50,000 for the manufacture of Enamel Steel Tile for wainscoting, fire fronts, hearths, ceilings, &c. The advantages claimed by the company are that the Tile are vermin proof, durable and easy to put up. It will be made in a great variety of colors.

TUBE MILL No. 1 of the Youngstown Iron, Sheet & Tube Company, at Youngstown, Ohio, was placed in operation and is producing Wrought Iron Pipe made from the company's Double Refined Puddled Iron. The company now have in operation their blast furnace, Sheet Bar mill, puddle department, a Sheet department for the production of their exclusive New Process Galvanized and Double Refined Puddled Iron Sheets, and the first of the three Tube mills. The remaining two

mills will be on in about 30 days. Work on the plant is progressing rapidly.

DISPATCHES from Waukesha, Wis., announce that the Waukesha Sheet Steel Company contemplate the building of an Open Hearth Steel plant, as well as the adding of a corrugating department. The difficulty of obtaining Steel recently is said to have induced the company to enter into the manufacture of Steel. The scarcity of Steel heretofore has compelled the works to suspend at various times. It is understood, however, that some of the mills have now resumed.

THERE will be no more open mills for the members of the Amalgamated Association of Iron, Steel and Tin Workers. July 1 was set by the Wheeling convention as the date on which lodges must have been reorganized in all open mills, or all members of the association must withdraw. The order may cause some vacancies in plants now open.

F. R. PHILLIPS & SONS COMPANY, Philadelphia, Pa., have commenced shipments on their contracts for Tin Mills and Machinery to the Huntington Tin & Planished Plate Company of Huntington, W. Va., and the Juniata Steel & Iron Company, Greencastle, Ind. They have a contract with the latter company for the entire equipment of Hot Mills, Tandem Cold Rolling Mills, Doubling Shears, Squaring Shears, Bar Shears, Lathes, &c.

THE WASHINGTON CHARCOAL IRON TIN MILLS, Washington, Pa., have declared the regular quarterly dividend of 3 per cent., payable July 1.

THE recently organized Indianapolis Tin Company, Indianapolis, Ind., now have their Tin Can plant in running order. They have purchased adjacent property on which they propose building an extension to the present plant, to be used for the manufacture of Lard and Paint Cans. This line, however, will not be taken up until the other lines are fully established.

THE production of Tin in the Federated Malay States was in 1900 and 1901, respectively: Perak, 355,589 and 385,066 piculs; Selangor, 269,490 and 302,598 piculs; Negri-Sembilan, 72,251 and 75,242 piculs, and Pahang, 12,728 and 22,084 piculs.

THE FERGUSON TIN PLATE COMPANY of Pittsburgh have made application for a charter. The new concern will take over the business of the Ferguson Tin Plate Company, Limited, operating a dipping plant at East Liberty, Pittsburgh, with a capacity of 500 boxes 20 x 28 inch Terne Plates per week.

GEORGE W. HEARTLEY of Toledo, Ohio, manufacturer of Eaves Trough Hangers, Power and Hand Punching Machinery, Tools and Dies, has purchased a factory building 33 x 99 feet, four floors, and will also erect, adjoining same, a factory 66 x 99 feet and two stories high. It is his intention to manufacture special machinery for the production of Metal Wheels of every description; also Punches, Dies and Die Forgings. His facilities for producing Eaves Trough Hangers will also be greatly increased.

THE SHENANGO AND NEW CASTLE WORKS of the American Tin Plate Company, at New Castle, Pa., have been closed down for about one week, to make necessary repairs and take inventory.

THE AULD & CONGER COMPANY, Cleveland, Ohio, report that the demand for Slate this season has been greater than ever before in their history. They have however, been able to take care of orders in a satisfactory manner on account of new machinery and other facilities installed at the quarries and larger forces of workmen.

THE APOLLO WORKS of the American Sheet Steel Company, at Apollo, Pa., are being dismantled, and the mills and other equipment are being removed to Vandergrift, Pa. The Apollo plant is one of the oldest owned by the American Sheet Steel Company, and contained 12 heating and 9 annealing furnaces, 1 muck and bar train, 6 hot and 2 cold mills, and 2 20-gross ton acid open hearth steel furnaces. The product of the plant was 18,000 net tons of Black Sheets, running triple turn. It is the intention of the American Sheet Steel Company to centralize the manufacture of Sheets at Vandergrift as much as possible.

THE ELLWOOD CITY WORKS of the American Tin Plate Company, at Ellwood City, Pa., are being dismantled and the mills are being removed to Monessen, Pa. The Ellwood City Works contain 6 double Sheet and Pair furnaces, 1 annealing furnace, 6 hot and 6 cold mills. The product of the plant was Black Plates for tinning and Cold Rolled Steel Sheets, the output being 12,000 gross tons annually, triple turn. The plant also turned out 5400 boxes weekly of Tin and Terne Plate, running double turn.

THE YOUNGSTOWN IRON SHEET & TUBE COMPANY, Youngstown, Ohio, have signed the Amalgamated Association scale. The scale signed covers the Muck, Bar, Sheet and Skelp mills.

Expansion Bolts.

McCabe Hanger Mfg. Company, 532-542 West Twenty-second street, New York, have put on the market a form of expansion bolts in brass, as here illustrated, designed particularly for plumbers. It is intended for fastening marble, granite, bronze or any material in position that would be discolored by using an iron bolt. The nut and shell is brass, the screw or bolt being of the same material, nickel-plated. They can be sup-

Expansion Bolt for Marble and Plumbers' Trade.

plied in various forms, such as square, round or flat countersunk heads, in the following diameters—viz.: 3-16, 1/4, 5-16 and 3/8 inch, the lengths of each diameter being 1, 1 1/4, 1 1/2, 1 3/4, 2, 2 1/2 and 3 inches. They can also furnish this style of expansion bolt with brass bolt and nut and iron shell at a lower cost, for such purposes as a shell of that material is adapted to.

Cost of a Central Acetylene Gas Installation.

In answer to a correspondent, the *Acetylene Gas Journal* of Chicago recently published the following estimate for installing a complete acetylene plant for a "town of considerable size" (apparently about 1000 inhabitants and 150 private customers), the generator being non-automatic. Building for generators, tools, storage, &c., \$250; generators, foundation, piping and erection, \$200; 2500 cubic feet holder erected, \$2000; 1000 feet 3-inch pipe at 33 cents, \$330; 7000 feet 2-inch pipe at 17 cents, \$1190; 5000 feet 1 1/2-inch pipe at 12 1/2 cents, \$625; 3000 feet 1-inch pipe at 6 cents, \$180; laying, testing fittings, refilling, &c., at 10 cents per foot, \$1600; 150 feet 3/4-inch service pipe at \$8, with labor, \$1200; 150 meters at \$5.50, \$825; 35 iron lamp posts, complete, \$700; incidental expenses, \$300; profit to erector, \$1000; total, \$10,400. If the plant supplied 150 customers within a radius of 3 miles and produced on an average 1600 cubic feet of acetylene per day, the working charges should be: Carbide at \$70, \$336 per month; labor, carriage, water, office expenses, lighting street lamps, \$150; leakage, depreciation and taxes, \$25; total, \$511 per month. Revenue: Acetylene at \$15, \$688.50; public lamps at \$18 per lamp per year, \$52.50; total, \$741 per month. This represents a profit of \$230 per month, or \$2760 per year, which is a return of 26 1/2 per cent.

GEORGE CALLAHAN & Co., 218 Front street, New York, advise us that their Steam Joint Cement and Roof Cement are both now in use by the United States Government. The company have increased their facilities so as to be able to keep up the claim that they make very prompt shipments.

AN IMPORTANT TRADE NOTICE.

The trade in general will be interested in one of the actions taken last week at Niagara Falls by both the Central Supply Association and the Association of Manufacturers and Jobbers in Plumbing Supplies, in reference to some business details, which will affect all engaged in the trade. It is only necessary to carefully read the following notice sent out by the associations, to see the justice of the action and to conform to the changes they necessitate:

Notice.

For the general information of the trade attention is called to the following well established

TRADE CUSTOMS:

PIPE.

Wrought iron pipe is a term used to distinguish wrought from cast pipe. It is construed to mean merchant pipe, and is generally made from soft steel. Persons desiring to obtain pipe made from puddled iron must designate genuine wrought iron pipe for which an extra charge is made.

DAMAGES.

We guarantee material sold, but only to the extent of supplying perfect goods for any found defective, and will not allow any claims for labor or consequential damages. The measure of damage shall be the price of any defective piece, such defective piece to be returned before credit will be given.

RETURNED GOODS.

When orders have been correctly filled, no credit will be allowed for goods returned, nor will teamsters be permitted to accept goods to be returned unless a full explanation has been made and our consent obtained. All goods returned, if accepted, will be credited at the same price at which they were charged, less 10 per cent. and all shipment expenses.

BREAKAGE.

All goods are packed by skilled men. If an article is broken in transit, the condition of the package at its destination is no evidence of its original condition. When goods are shipped to a customer and have been receipted for by a Transportation Company, in good condition, the shipment immediately becomes the property of consignee, no allowance will be made for breakage in transit and consignee must look to Transportation Company for relief.

WILL HEATING GOODS ADVANCE?

Notwithstanding that considerable pressure has been brought to bear at the various meetings of the manufacturers of house heating boilers and radiators for an advance in prices, the conservative element has succeeded in maintaining the policy of a stable market and holding the prices of both boilers and radiators at practically the same level throughout the year. Since their recent meeting at Atlantic City the price of iron has taken another jump. In view of the stringent conditions which now prevail in the iron market and the outlook for their continuance, it is a question whether the conservative element can be induced to depart from the well established policy of uniform prices that has been of such general benefit to the whole trade by enabling a bid to be given early in the year and the contract closed at any time without anxiety as to advances and the loss to the steam fitter which attended the fluctuation of prices in the past. If the influence of the conservative element should not be strong enough to continue the present prices and an agreement is reached at the next meeting to make an advance, it is possible that quotations will be withdrawn and that higher prices may take effect before August 1, the time at which some independent concerns are contemplating making an advance. The opinion that such a contingency may arise is entertained by some steam fitters and is manifested in the promptness with which they place orders, sometimes with the request that a little time be given to prepare the specifications so that prevailing prices may be obtained. Evidently buyers have been closely studying the conditions which have an important bearing on this branch of trade and feel that conditions warrant an advance. Some reports indicate that less pressure is being used to secure lower prices,

satisfaction being expressed when no advance on present prices is asked. Indications are not wanting that some manufacturers are preparing to secure more money for their goods should iron, labor and supplies continue at the present high level.

New York City Notes.

July 1 has arrived and the new rate of wages has gone into effect. The delegates of the Journeymen's Association are busy in looking up those master plumbers who are not paying the increased rate of wages, and the Joint Conference Board are promised plenty of work at their next stated meeting.

T. C. Andrews, who was formerly an active Bronx plumber, died last week after a long illness. The funeral services were held from his late residence, 682 Eagle avenue.

Among the large jobs lately given out was the plumbing in the new power house of the Third Avenue Railroad Company, at Kingsbridge, which is to be done by Ex-Deputy Sewer Commissioner M. F. Donohue.

Local trade still continues quiet, but from present indications there promises to be a good fall business in all branches of the trade.

One of the new Civil Service tenement house inspectors was on a West Side job lately, and seeing a line coming out from a closet, asked what that water pipe was used for. He was instructed by the plumber on the job that it was the back air to the trap. As the Tenement House Department is young yet, there is time for the inspectors to learn.

Bronx Association is bound to be active for the good of its members, although just now business is at a practical standstill in that locality. The president, Peter Schweeckert, of Williamsbridge, and the new secretary, J. W. Sweeney of Bedford park, elected vice McEvily, resigned, are hustling for new members and preparing for their first annual outing.

The Plumbers' Examining Board had a very busy month in June, 30 applicants having presented themselves. Not all of them, however, passed the ordeal.

The Speakman Ventilated Urinals.

The Speakman Supply & Pipe Company, Wilmington, Del., have sent us a copy of their catalogue D, with various supplements, devoted to plumbers' brass goods and the hardware adapted for marble and slate partition work. In the supplements are shown bath lavatory supply and waste fittings and traps, as well as a variety of supports for the solid porcelain lavatories that are coming quite generally into use. Of special interest are the Speakman ventilated urinals for schools and public buildings. These urinals are constructed with an air chamber at the back of the slabs, which is connected with the ventilating flue, in which an exhaust draft is kept up continually by the burning of gas jets. The urinals are provided with automatic or positive flushing devices and are arranged to be set either in single or double row. In either case an exhaust draft is effected continuously by means of the heated vent flue, which is said to draw the air equally from each of the urinal stalls when a number are set in line.

LEWIS NUSS, Weatherly, Pa., has the contract to install the heating, ventilating and sanitary systems in the \$60,000 school building that Charles M. Schwab has presented to the town of Weatherly, and which will be named the Mrs. Schwab School. Mr. Nuss is using Sun Ray Boilers and Roman Radiators, made by the J. L. Mott Iron Works of New York. The plumbing goods made by the same house are also being used in the sanitary system.

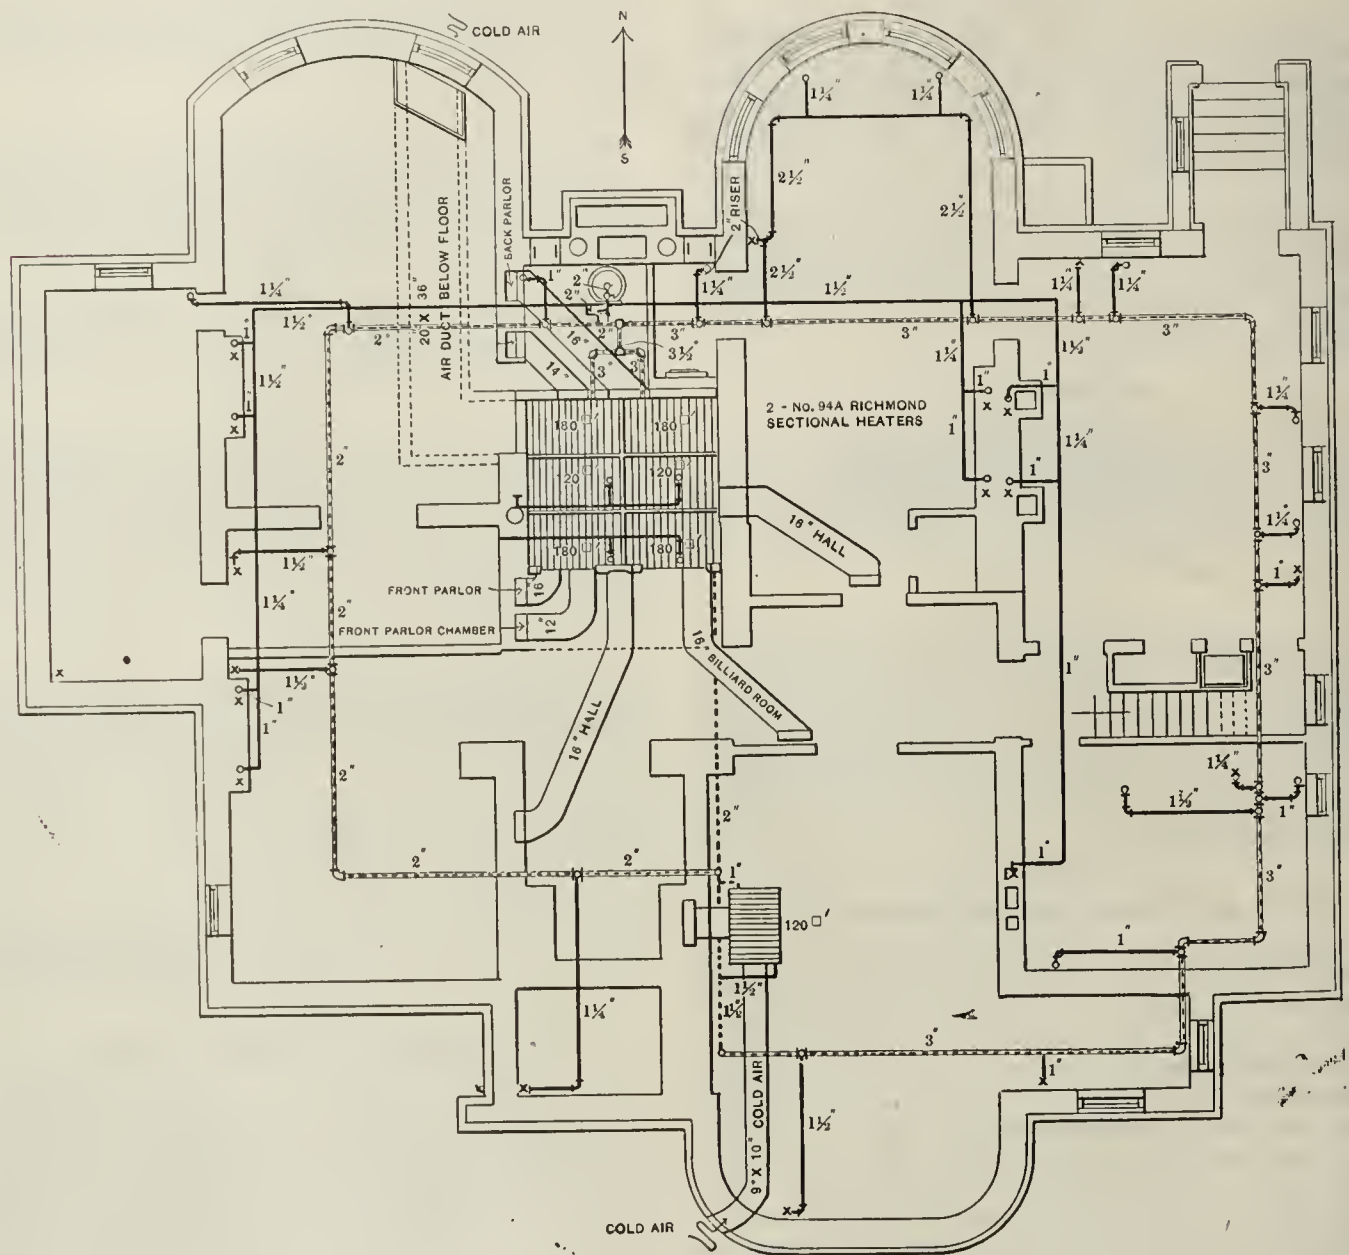

Heating and Ventilating a Residence with Steam.

The homes of Americans are famous for the comfortable temperature which prevails in them during the winter season. In arriving at this distinction many advances have been made, and the different systems of heating have been developed to a satisfactory degree of perfection. In solving the problem of heating, the question of ventilation has also received the attention to which it is entitled, and the most modern systems provide a pure atmosphere, as well as a comfortable temperature. Favor is shown those systems which supply

The location of the heating boilers, the indirect radiators and the piping system is shown in Fig. 1, which is a plan of the basement of the building. This plan also shows the location of the ventilating boiler and the pipe which runs from it to connect with the heating coils in the ventilating flues. The work to be done by the heating system can be seen from a study of Figs. 2, 3 and 4, which are plans of the first, second and third floors respectively. For the heating two No. 94A Richmond steam boilers, composed of nine sections each, are used.

THE INDIRECT RADIATORS AND WARM AIR SUPPLY.

These boilers are placed in a brick chamber and suspended above them are six stacks of indirect radiation,

Heating and Ventilating a Residence with Steam.—Fig. 1.—Plan of Basement, Showing Piping System.

continuously an inflow of pure, warm air, and their use has revealed the necessity of providing some method of exhausting the air in a building to make room for it. The open fire places which have been regarded as luxurious for a number of years are now being used to create an outflow or exhaust current by means of heat supplied from a fire or otherwise. By removing the foul air the efficiency of the heating system is increased by facilitating the inflow of fresh, pure air.

An excellent example of such a system is found in the residence of George N. Clemson, at Middletown, N. Y., which was designed by and installed under the supervision of A. McGonigle, heat for all purposes being supplied from Richmond steam boilers made by the Richmond Stove Company of Norwich, Conn. The heating system provides direct, semidirect and indirect radiation. To insure an inflow of fresh air open fire places are so arranged that when fires are not burning and exhausting the air the flues are heated by means of steam coils placed in them

the central stacks having each 120 square feet of surface, while the outer stacks have each 180 square feet of surface. Cold air for supplying these stacks is taken from the north side of the building, through a cold air duct 20 x 36 inches in size, and is brought into the chamber containing the boilers and the indirect radiators. By this means all of the heat thrown off by the boilers and the flow and return headers is used to temper the air before it passes up through the indirect radiators in the top of the chamber.

From the heating chamber hot air pipes lead, as shown, a 16-inch pipe leading to a 9 x 24 inch flue for heating the back parlor on the first floor, and a 14-inch pipe leading to a 9 x 18 inch flue for heating the chamber immediately above it. A 16-inch pipe leads from the front of the chamber to a 9 x 24 inch flue for heating the front parlor, and a 12-inch pipe is carried to a 9 x 18 inch flue for heating the chamber immediately above. There are two pipes for heating the large hall on the first floor and the halls on the second and third floors.

A 16-inch pipe is carried from the front of the heating chamber to a 9 x 24 inch flue, feeding a register near the entrance hall. A 16-inch pipe runs from the east side of the heaters to another 9 x 24 inch flue, feeding a 12 x 24 inch register in the hall under the main stairs. Another 16-inch pipe leads to another 9 x 24 inch flue for heating the billiard room on the first floor. The chamber on the second floor immediately over the billiard room is heated by means of an indirect radiator having 120 square feet of surface, placed at the base of a 9 x 18 inch flue, which leads to a 12 x 18 inch register in the billiard room chamber.

The indirect radiation placed in the heating chamber immediately above the boiler is supplied with steam by separate connections from the flow headers, and the

The plan of the second floor in Fig. 3 will show that the bathrooms, library and dining room chambers are provided with semi-direct radiators for supplying fresh air, and that the hall and other chambers are heated by an inflow of fresh, warm air. The two guest chambers on the third floor are the only rooms on that floor that are heated by an inflow of air in connection with direct radiation. From the description, it will be seen that provision has been made for the entrance of a large quantity of fresh air, and also provision has been made for heating.

DIMENSIONS AND APPARATUS.

For the benefit of those who may wish to make a closer study of the details and a comparison of proportions, the various plans give the space heated, the wall

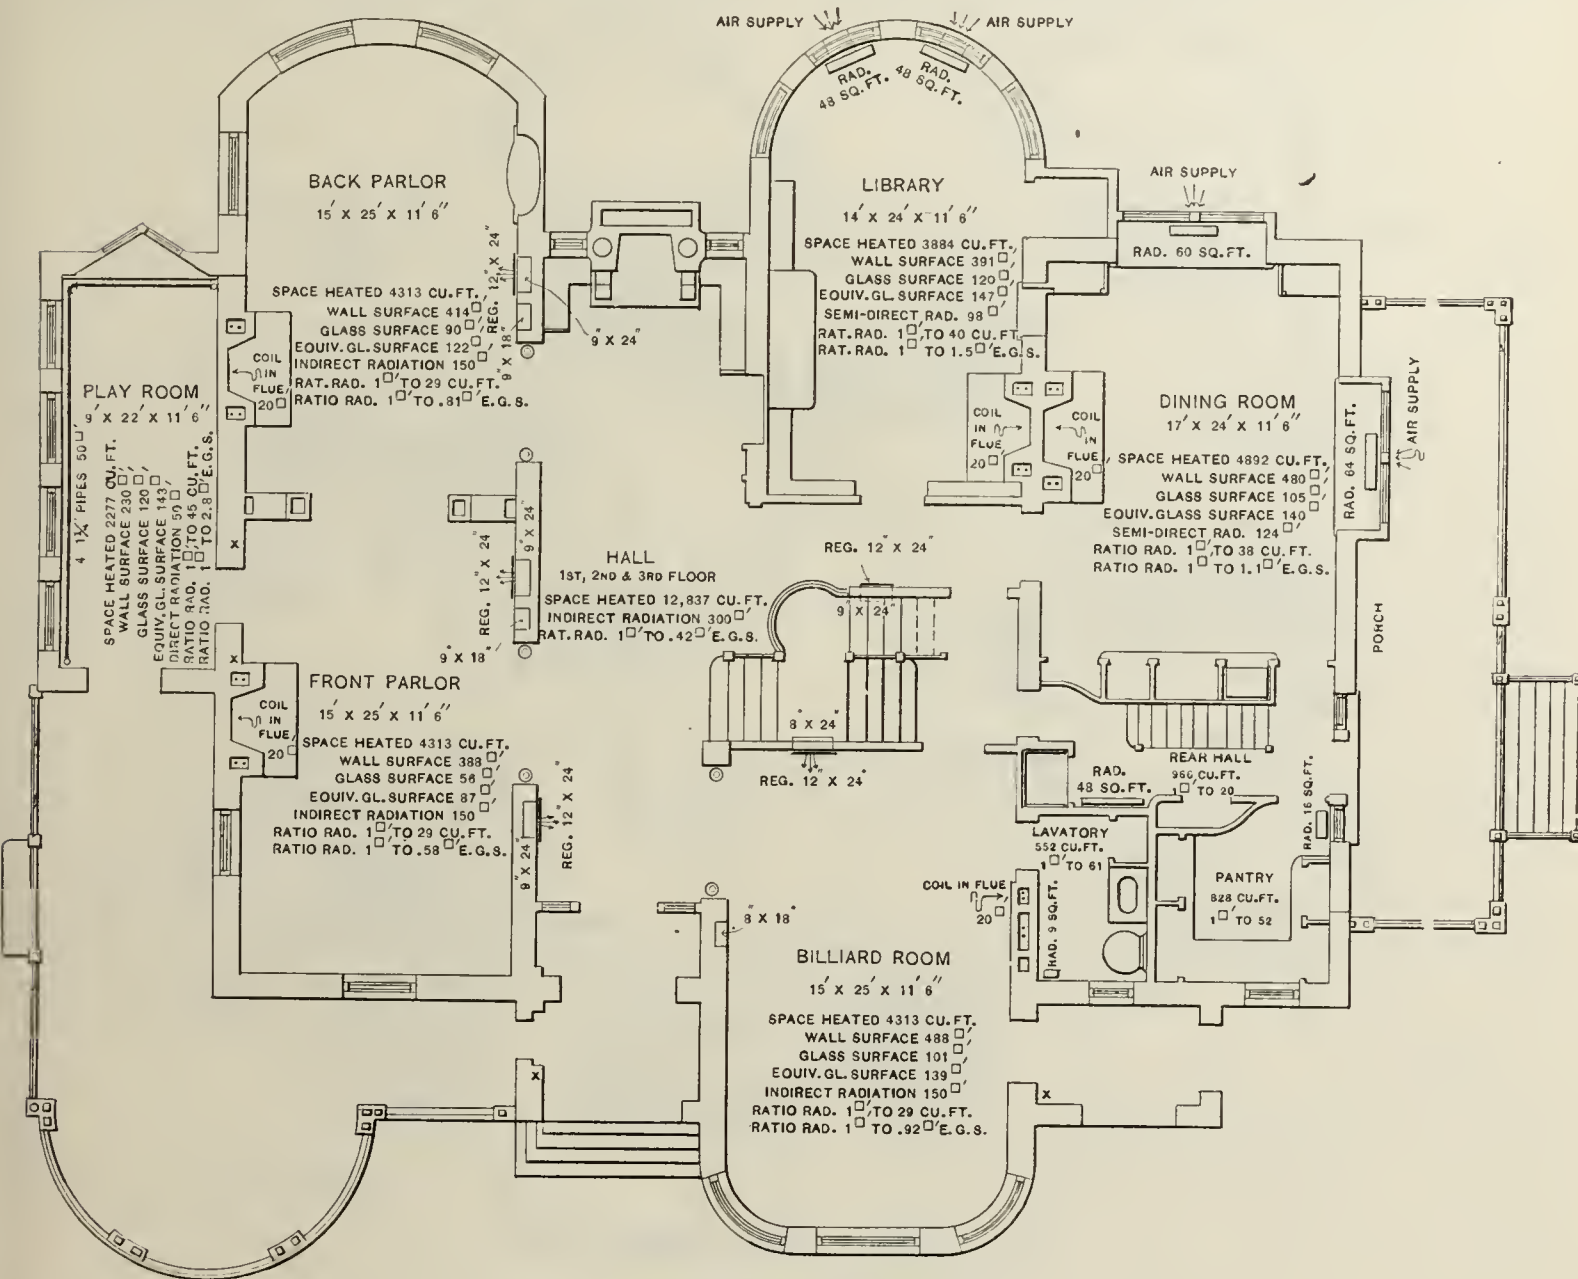

Fig. 2.—Plan of First Floor.

condensation from these radiators is carried to the main return.

THE CIRCUIT STEAM MAIN.

A 3-inch steam main is taken from each of the boilers, connected to a 3½-inch pipe and carried to the heat distributing mains, which are arranged on the circuit system. A 3-inch pipe is used to make the circuit of the east side of the building, branches being taken off to supply the various radiators shown on the plans of the upper floors. After these circuit mains pass around the building they connect into a 2-inch main return, which is carried to and connected with the return headers to the boilers. It will be noticed that the library and dining room on the first floor are heated by means of semi-direct radiators, openings being provided in the wall for the entrance of a supply of air to the radiators which is heated and distributed through the room, aiding the warming done by direct radiation from the radiators. The lavatory, pantry and rear hall are heated by means of direct radiators.

and glass surface exposed and the equivalent glass surface in each room, and also the proportion of radiation to the space heated and to the equivalent glass surface. A further study of these details will be of interest. It is found that the space heated amounts to 76,053 cubic feet, while the wall surface amounts to 7341 square feet. The glass surface exposed is 1599 feet, with a total equivalent glass surface of 2172 feet. To offset for the heat lost through this surface and to maintain a comfortable temperature at all times, two No. 94A nine-section Richmond steam boilers have been provided. Each of these boilers has a grate 36 x 41 inches in size, making a total grate surface of 20½ square feet. The boilers also have a total of 330 square feet of heating surface. These boilers must supply steam for 366 square feet of direct radiation and 1080 feet of indirect radiation.

It is generally calculated that indirect radiation adds a 50 per cent. greater tax on a boiler than direct radiation, and the 1080 feet of indirect radiation used is

equivalent to 1620 square feet of direct radiation. The tax of semidirect radiation is rated as 25 per cent. greater than direct radiation, so that the 639 feet of semidirect radiation is equivalent to 799 feet of direct radiation. This equivalent radiation amounts to 2785 square feet of direct radiating surface. By adding 20 per cent. for the surface exposed in the mains it will be found that the total tax on boilers amounts to 3342 square feet. The boilers selected for the work, however, are each rated to have a capacity of carrying 2500 square feet of surface, which shows that there is ample capacity for the work to be done.

THE RELATIVE PROPORTIONS.

Another interesting feature of this system is the proportion which the different parts bear to each other.

indirect stacks is about $\frac{3}{4}$ square inch of area to each square foot of surface exposed. The flues for carrying the hot air to the first floor bear a proportion of 11-5 square inches to every square foot of indirect radiation at the base, while those to the second floor have an area of 1 square inch for every square foot of indirect radiation at their base.

Referring to Fig. 1 it will be found that a $3\frac{1}{2}$ -inch main leads from the boiler supply to the heating mains. This main has an area of 9.8 square inches, and the area bears a proportion of 1 square inch to 136 square feet of direct radiation carried, allowing for the extra tax which the one stack of indirect radiation and semidirect radiators add to what the work would be in direct radiation.

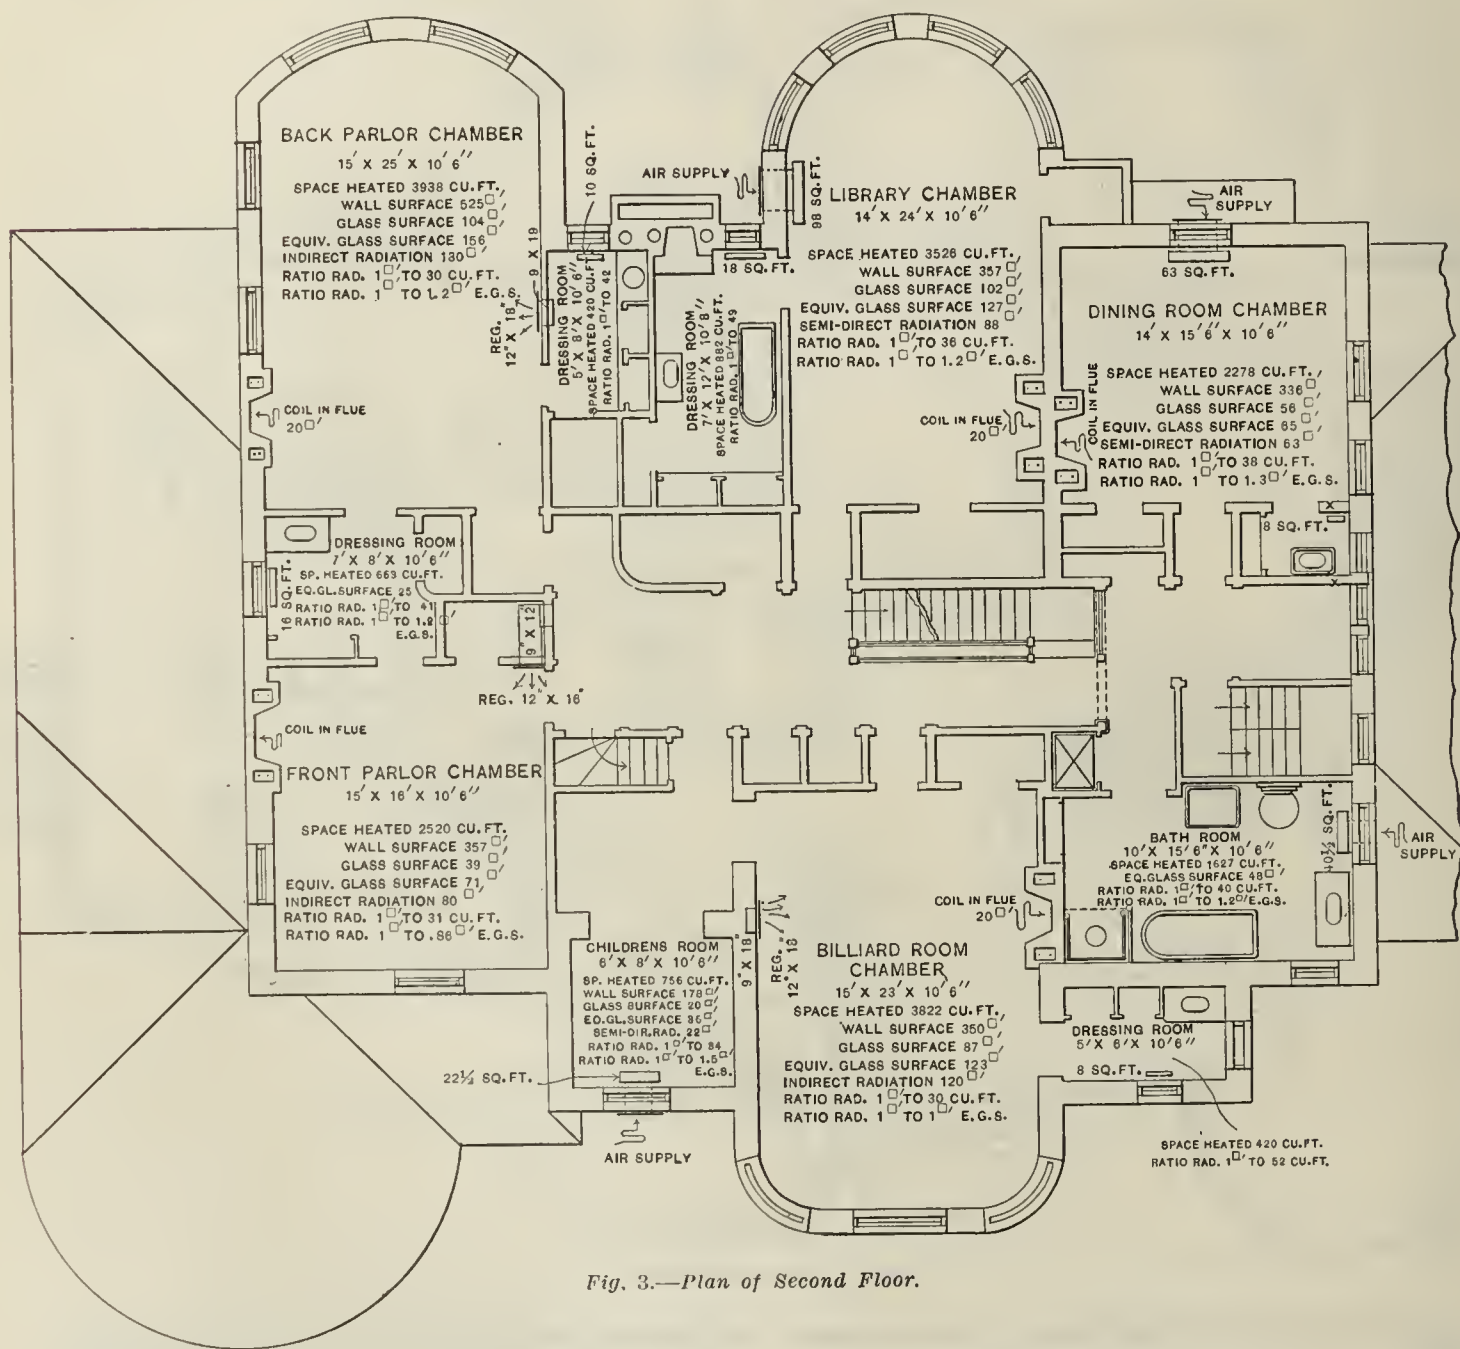

Fig. 3.—Plan of Second Floor.

The grate bears a proportion of 1 square foot to 16.5 square feet of boiler surface, to 63 square feet of direct radiation, to 3322 cubic feet of space heated, to 358 square feet of wall surface exposed, and to 106 square feet of equivalent glass surface. The boiler surface bears a proportion of 1 square foot to 10.4 square feet of radiation, to 230 cubic feet of space heated, to 22.2 square feet of wall surface and to 6.5 square feet of equivalent glass surface. The proportion of radiating surface given on the different plans shows the actual relation of the radiators used to the work done. When the equivalent in direct radiation which the boilers must carry is compared with the work done, the 2785 feet of direct radiation bears a proportion of 1 square foot of surface to 27 cubic feet of space heated, to 2.6 square feet of wall surface, and to 0.78 square foot of equivalent glass surface.

It will also be noticed that the cold air supply to the

THE VENTILATING SYSTEM.

It has already been shown that provision has been made for bringing a large volume of fresh air into the building, and it has been mentioned that open fire places heated either by fire or steam coils have been provided to exhaust the air. To accomplish this a No. 418 Richmond round boiler having a grate 18 inches in diameter and 35 square feet of boiler surface has been provided for the work of heating the coils in the vent flues.

A 2-inch main rises from this boiler and supplies two $1\frac{1}{2}$ -inch horizontal branch mains, one running in each direction, east and west. The branch main running to the west side of the house supplies the four coils placed in the flues connected with the open grates in the front and back parlors and the two chambers immediately above. The $1\frac{1}{2}$ -inch branch running to the east side of the house has a $1\frac{1}{4}$ -inch branch carried over to supply the two coils placed in the flues in connection with the

fire places in the library and the library chamber. The main is continued and supplies two coils placed in the flues connected with the dining room and dining room chamber. After supplying these coils, it is carried across to the south side of the building to supply the coil in the flue which ventilates the billiard room and billiard room chamber. These coils are arranged in the flue with a riser to a return head and a return from it, and each coil exposes 20 square feet of surface.

The surface in these coils bears a proportion of 1 square foot of surface to the varied amount of air to be handled, according to the size of the room. The proportion is 1 square foot to 126 cubic feet for the front parlor chamber to 234 cubic feet for the dining room on the first floor. As the ventilating flues are but 9 x 12 inches in size, and as the heating surface is in the shape of a riser and a return, it is calculated that there is

Valves are also placed on the heating mains, so that the steam from the small boiler can be turned into the mains of the heating system for supplying the direct radiators near it when a small amount of heat may be useful in taking the chill off a room in the mornings and evenings when a fire in the larger boilers would be unnecessary. All of the boilers are connected with smoke flues of ample capacity by means of heavy galvanized iron pipe, and the boilers are equipped with special dampers for regulating the draft and temperature automatically. This system has now been in operation several winters with satisfactory results.

The Pittsburgh Valve & Fittings Company.

The Pittsburgh Valve & Fittings Company, composed mostly of Pittsburgh capitalists, have been formally organized and will apply for a charter. The new concern

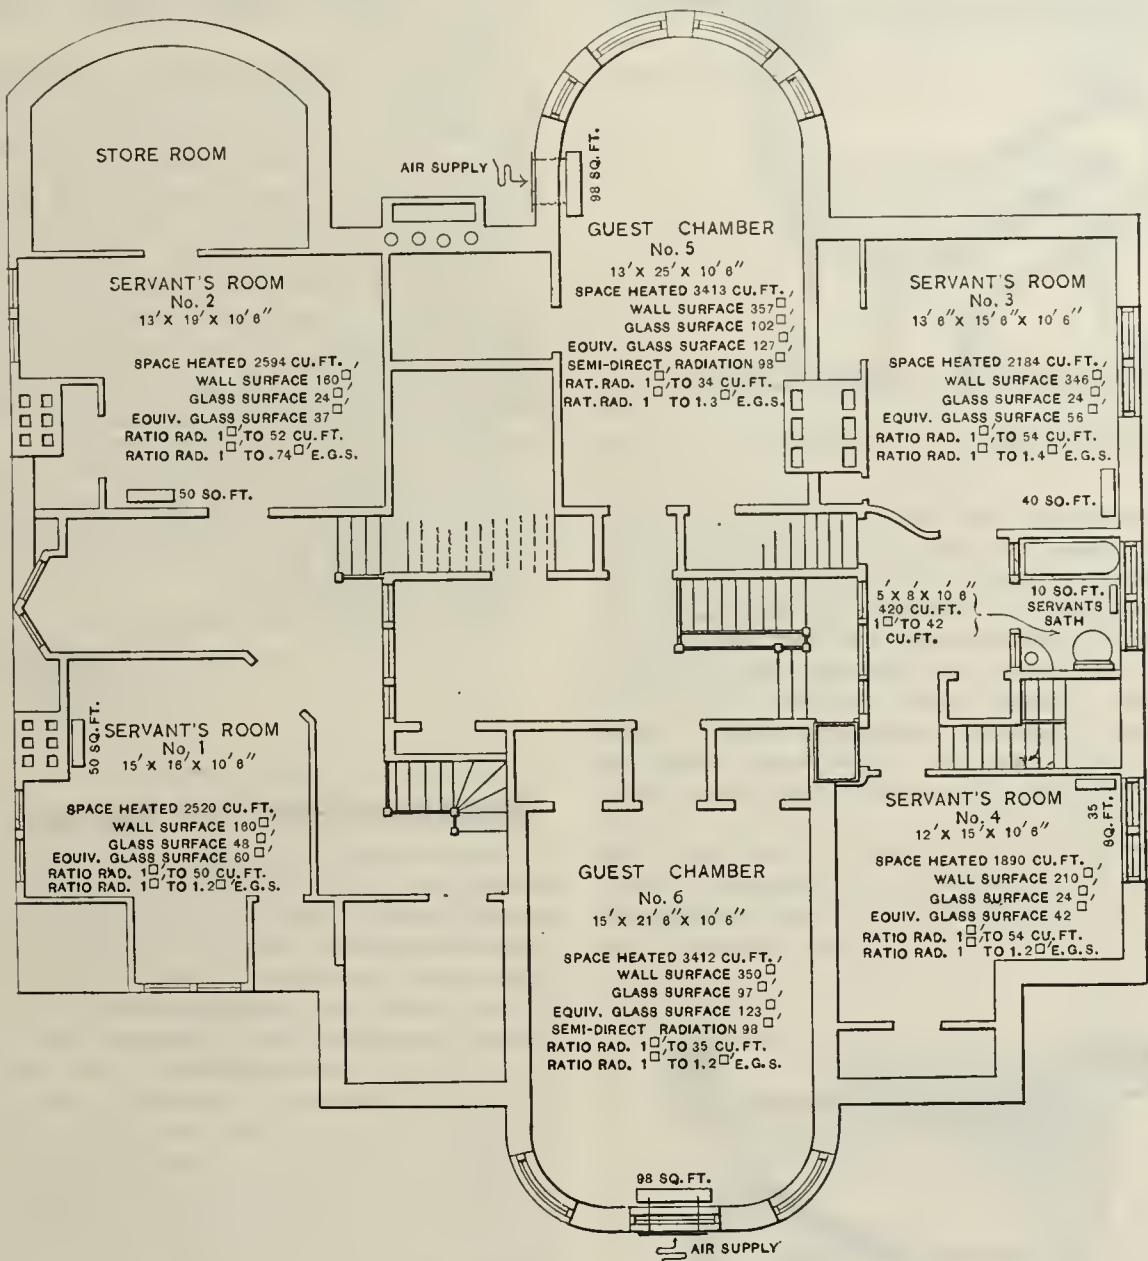

Fig. 4.—Plan of Third Floor.

ample surface to keep the air in the flue warm enough to raise the temperature of the air in the flue and create an upward movment, which will exhaust the air from the different rooms and change the air in the building at least twice an hour.

THE BOILER FOR VENTILATING PURPOSES.

The boiler for this work is rated to have a capacity for giving 300 feet of direct radiation, and as there are but nine coils in the flues exposed, in all 180 square feet of surface, it will readily be seen that the boiler has ample capacity for carrying the surface, and also to furnish the heat that may be lost through the piping system in the cellar. This smaller boiler is provided for use during the summer season, and a connection is made between the 2-inch main of the heating system and the mains of the ventilating system, and a valve arranged so that it can be opened so that the ventilating system can be carried by the heating boilers in the winter season, when they are in use.

will build a plant at Barberton, Ohio, for the manufacture of valves and fittings. The corporation have organized with James I. Buchanan, William D. Hartupée, L. D. Castle, J. A. O'Neill and M. J. Alexander as directors, and the board have elected W. D. Hartupée president and M. J. Alexander secretary and treasurer. A site in Barberton is now being covered with buildings for the new plant. The plants call for 12, constructed of stone and brick. The first buildings will cover 4 acres. They are in a 20-acre plot, directly connected with the Baltimore & Ohio, the New York Central, the Pennsylvania and the Erie lines. The machinery is to be of special design, each machine to be operated by an individual electric motor. The company report having a cash capital at present of \$300,000. The general offices will be located at the works, which will start in March. The concern purpose to manufacture their own brass, securing copper from Montana and spelter from Illinois.

WASH DOWN SIPHON CLOSETS.

BY HELMAR.

"Wash down siphon" is a plausible name that conveys an idea of what takes place during the operation of a water closet that consists of a good combined hopper and trap, with a jet in the back. The wash down siphon closet proper differs but little in principle from a jet siphon closet, except in the location and character of the jet. A portion of the flush water is diverted through a channel and discharged into the bowl at the back, somewhat as shown in Fig. 1. Actual siphonage depends on the shape of the trap, as well as the height, size

Wash Down Siphon Closets.—Fig. 1.—Wash Down Siphon Jet Closet.

and angle of the jet. The lower and more submerged the jet, the quicker and stronger the siphonage should be. The higher the jet, up to a reasonable limit, the quicker the jet water will wet and cut the paper down. It is the energy of the jet water and the direction the jet is thrown that causes the siphonage, which from the top of the bowl appears to be genuine. In the wash down the shape of the trap has much to do with directing the jet water, while in the jet siphon closet the curve of the trap wall has nothing to do with directing the water from the jet.

A combined hopper and trap with extra heavy fan wash at the back of the flush rim, as indicated in Fig. 2, is said to be a wash down siphon. They are much easier made in iron than the closet with jet channel in the

Fig. 2.—A Plain Wash Down Siphon Closet.

back and usually wet and cut the paper down better and quicker than the jet closet does. When made to sell as wash downs the action is usually good, but the trade favors the jet because its service need not be sacrificed in any sense in favor of wetting the paper. The flush rim can be made to take care of the paper and the jet left to operate wholly on the contents of the trap.

Wash down siphons are made both in iron and earthenware, and sell at a lower price than jet siphon closets. Two-inch spuds are usual when low tanks are used, but for high tanks 1½-inch flush answers.

The Late Samuel L. Malcolm.

The following resolutions were adopted by Manhattan Branch, Association of Master Plumbers of the City of New York, upon the death of their late president, Samuel L. Malcolm. The resolutions were suitably engrossed and presented to his family by the committee on July 1:

Whereas, Almighty God in his wisdom has seen fit to remove from us our fellow member, Samuel L. Malcolm; and,

Whereas, By his death this association has lost one of its oldest and most highly esteemed members. Therefore, be it

Resolved, That this association wishes to place on record and express in this form the personal respect and affection in which he was held by all our members. Active in the performance of his personal duties and interest in association work to the day of his death, his sudden passing away was a shock to his many friends; so be it further

Resolved, That we here testify to the personal worth as a member of this association of our deceased friend. His standing and record in the trade was one of honor and credit. He was a man whose friendship and good will were highly valued. Our association was highly honored by his connection with it, and benefited by his wisdom and good judgment. His whole life was an example and model of manhood's best qualities. In time of national danger he served with honor his country on the field of battle. In days of peace he labored with self sacrifice to perfect his trade organizations, local, State and national. The recognition of his ability was shown by his election to the office of president of both local and national associations of master plumbers, which positions were filled with honor, both to the office and the man. Therefore be it finally

Resolved, That to his bereaved and sorrowing family we present, in all sincerity and respect, our most profound sympathy and condolence on their great loss, and that these resolutions be entered on the minutes of this association and a copy duly certified and engrossed be presented to his family.

Adopted unanimously June 3, 1902.

W. J. McDERMOTT,
ALEX. BRYANT,
PHILIP BRADY,
JOHN RENEHAN,
Committee.

International Steam and Hot Water Boilers.

Steam fitters and heating contractors will be interested in the new catalogue just issued by the International Heater Company, Utica, N. Y., devoted to the International steam and hot water boilers. The catalogue consists of 44 pages, printed in two colors on paper of high finish and bound in a drab cover. The introduction states that this catalogue shows the several lines of boilers manufactured by the house and calls attention to the enviable reputation their goods enjoy. In enumerating the claims for efficiency, economy and convenience, attention is first called to the report of an engineer on a trial duty test. The statement is also made that every boiler is mounted complete and tested before leaving the factory, then carefully taken down and packed so that the purchaser is sure of having an accurately fitted piece of goods. The product of the company is marketed through the trade only, they doing no contracting or installation work.

The first section of the catalogue shows, by means of general, partly assembled and broken views, the construction, surface and fire and water travel of the Carton boilers, and the text, in addition to giving a detailed explanation of the construction and operation, states that the boilers are made with grates 20, 32 and 42 inches wide. The next section of the catalogue is devoted to the Palace Queen vertical sectional boiler of the return flue type, adapted to a wide variety of use, although not made in sizes for the heavy duty that the Carton is designed for. The Palace Regent, or Carton E, is made for both steam and hot water heating, and is cast in one piece, with water chamber diaphragms so arranged as to secure both a large fire surface and an indirect draft. The International F series and the Palace King steam and hot water boilers are made with round fire pots and are of the horizontal sectional type, the flue openings being staggered so as to secure an in-

direct draft and the principal heat of the products of combustion. The International G series boiler is designed for heating hot water storage tanks or for smaller work, and is made in a variety of sizes of capacities ranging from 75 to 425 square feet of direct hot water radiation.

The remaining pages of the catalogue contain much matter of interest and assistance to heating contractors who design steam and hot water heating systems for residences and greenhouses, and also gives information as to the size of chimney, which is indispensable in the operation of large boilers carrying a large amount of radiation. The catalogue contains neither prices nor ratings, which will be sent separately on application to all who desire them.

Heating and Plumbing Notes.

THE ROME SANITARY WORKS, Rome, N. Y., are sending out circulars devoted to their guaranteed Enameled Bathtubs. One circular, printed in blue and brown, is devoted to the Romania, a new shape combining the advantages of both the French and Roman patterns. This Tub has a 3-inch rim, is 29 inches wide over all, 17 inches deep on the inside and stands 23 inches high on the legs. This is said to be a high grade Tub in both material and workmanship, and is adapted for the various styles of supply and waste fixtures.

THE COLUMBUS BRASS COMPANY, Columbus, Ohio, have favored us with a copy of a circular devoted to their Automatic Flushing Tanks, which are made both with a bent wood shell and with a square shell having rounded corners. The Tanks are also furnished with molded tops when desired. They are made in different kinds of wood and finish adapted for urinals, and of different sizes to suit from one to ten urinals. The operation is said to be as perfect when arranged to flush once in three hours as when arranged to flush once in three minutes. It is further claimed that variation in water pressure does not affect the operation of the Tanks.

THE GURNEY HEATER MFG. COMPANY, Boston, Mass., have recently been distributing among their friends in the trade a neat transparency designed for use in a conspicuous place on either a door or a window. It is accompanied by instructions for affixing to the glass so as to produce the best results. The transparency measures 9 x 11 inches and is printed in two colors. In the center is a general view of a Gurney Heater, which appears in black upon a green groundwork. Above this in red and black is the inscription, "We sell Gurney Heaters; Hot Water or Steam," while below the Heater are the words "Always Reliable."

ANDREWS & JOHNSON of Chicago bid \$3600 and secured the contract for putting a ventilating fan in the City Library at Des Moines, Iowa.

CORRY & WERNENTINE COMPANY bid \$1167 and secured the contract for installing the heating system in the new East Hill High School Building at Muscatine, Iowa.

THE P. R. CRAWFORD HEATING & PLUMBING COMPANY of Cleveland, Ohio, have the contract for installing the heating and power plant at the new works of the Structural Steel Company at Canton, Ohio.

B. J. LOGIERS, Paterson, N. J., bid \$5908 and secured the contract for heating, plumbing and gas fitting in the new building of Louis F. Braun.

T. F. DEXTER of Portland, Maine, representative of the Warren Webster Company and the American Steam Heating Company of Camden, N. J., is superintending the installation of the Webster system of heating in the Lafayette Hotel, at Portland, and the Penobscot County Court House, Lewiston, Maine.

THE WELLS & NEWTON COMPANY, New York City, bid \$9585 and secured the contract for the heating, plumbing and gas fitting in the new plant of the Verona Chemical Company.

WARDEN & LEESE, Marion, Ohio, have the contract for plumbing the new building of the Cleveland Bakery Company.

WILLIAM H. BURNETT, manager of the plumbing department of the Stamburgh-Thompson Company, Youngstown, Ohio, has secured the contract for plumbing a \$60,000 apartment house.

THE FARGO PLUMBING & HEATING COMPANY of Fargo, N. D., have the contract for the heating system and electric wiring for the new McHench Building in that city.

R. W. WALKER, chief of the Sanitary Department of Birmingham, Ala., in his report for 1901, urgently recommends the appointment of a competent inspector of plumbing.

THE first meeting of the stockholders of the International Steam Pump Company of New York City for the election of officers was held at Lockport, N. Y., recently, when the following officers were elected for the ensuing year: Directors, J. W. Dunn, Max Nathan, C. L. Broadbent and Arnold Tanzer of New York; E. C. Lufkins of Buffalo, T. E. Ellsworth and N. M. Clark of Lockport. The Board of Directors elected T. E. Ellsworth of Lockport, president; E. C. Lufkins of Buffalo, vice-president and general manager; N. M. Clark of Lockport, secretary, and Max Nathan, New York, treasurer.

GEORGE M. COUCH, Hartford, Conn., has the contract for installing a 1700-foot Carton Steam Boiler in a building for E. S. Drake. He has recently completed the installation of a 2000-foot Carton hot water heating plant.

A VERY neat pamphlet printed in two colors received from the Pierce, Butler & Pierce Mfg. Company, Syracuse, N. Y., is devoted to the Pierce Florida Steam Boilers and the Tropic Hot Water Boilers, of both the surface burning and magazine feed type. These Boilers are shown by means of general and broken views and views of partly assembled Boilers, so that the construction, heating surface and fire and water travel can be readily understood. These Boilers are made in a variety of sizes, with fire pots ranging from 16 to 36½ inches in diameter, and rated to carry from 375 to 2100 square feet of direct steam radiation.

T. C. PULSFORD, superintendent of the works at Leicester, England, of Ashwell & Nesbit, Limited, of London, is making a visit to the United States for both pleasure and business. He doubtless will be afforded a cordial welcome through the kindly feeling entertained by many American heating engineers for D. M. Nesbit, who has an extensive acquaintance in the United States.

J. H. LESLIE, formerly of Hillsboro, Va., informs us that he has removed his Plumbing, Wind Mill and House Heating business to Leesburg, Va., where he has facilities for carrying on the business on a much larger scale than heretofore. Mr. Leslie is desirous of receiving catalogues from houses manufacturing goods in his line, also price-lists and discounts.

THE KEYSTONE VALVE & MFG. COMPANY, Pittsburgh, Pa., recently incorporated, have secured a site 20 x 110 feet on Carson street, where they will immediately erect a two-story building, part of which will be used as a brass foundry and the rest as a machine shop.

THE LIMBERG ENAMELING COMPANY, Cincinnati, Ohio, have secured the building and equipment of the Enterprise Foundry Company in that city, to which they will remove from their present works, and also make considerable additions. In addition to making castings for their own use in the manufacture of Sanitary Goods, the company will conduct a jobbing foundry business. In the new plant the company will secure facilities which will enable them to about double their present output.

WORK on the new factory of the Sterling & Skinner Mfg. Company, Chicago, is being pushed rapidly to completion. The firm intend to manufacture Brass Goods for steam, water and gas. R. R. Sterling, F. C. Skinner, E. J. Roney and J. F. McDougall are all experienced men, having formerly been with the McRae & Roberts Company. They now have temporary offices on the fifth floor of the Chamber of Commerce Building.

MENAB & HARLIN of New York City are adding another story to their foundry building at Paterson, N. J.

T. J. O'MALLEY has been appointed plumbing inspector at Scranton, Pa.

THE BUFFALO, N. Y., ACADEMY OF MEDICINE recently adopted resolutions recommending the speedy selection of a heating and ventilating system for the public school buildings of the city. The majority favored the use of a mechanical system of heating and ventilation, although one member maintained a positive opposition to the use of mechanical apparatus.

JOHN F. HANSON, a well-known and highly esteemed citizen of Providence, R. I., died suddenly on Monday afternoon, June 23. Mr. Hanson was born in Liverpool, England, in 1844. As a young man he acted as a book-keeper, but he had started in the plumbing business a short time since. Mr. Hanson was a veteran of the Civil War, a Free Mason and an Odd Fellow. His death was due to apoplexy. He is survived by a daughter and a son.

MAYOR CONWAY of Troy, N. Y., has appointed Thomas H. Lodge and John J. Powers members of the Board of Plumbing Commissioners.

THE Master Plumbers' and Heating Engineers' Mutual Protective Association have been incorporated, with office at 218 Clay street, Paterson, N. J. The members are Robert Beaumont, James H. White, William McCuen, David McGinnis and Robert Quinn.

THE UNITED STATES SANITARY MFG. COMPANY announce that they have established a New York office in the St. Paul Building, 20 Broadway, where all communications relating to prices or orders should be addressed. The New York office will be under the management of C. A. Jaynes. It is the intention of the United States Sanitary Mfg. Company to make a complete line of up to date Enameled Sanitary Goods, and they will mail from time to time advance sheets of their forthcoming catalogue, which will be issued as promptly as possible after the patterns are completed. At the present time their new foundries and enameling plant are working to their full capacity, and they are now in a position to furnish all sizes of 2½ and 3 inch Roll Rim Bathtubs, together with a number of styles of Lavatories, Sinks, &c. All goods will be marketed through the jobbing trade.

L. O. KOVEN & BROTHER, 50 Cliff street, New York, manufacturers of high pressure Galvanized Range Boilers, are enlarging their plant in Jersey City, which now has a frontage of 250 feet on Mountain Road and 525 feet on Paterson Plank Road. The improvements consist of an addition of 10,400 square feet to the boiler plant, equipped with new tools for making large size Hot Water Tanks and Heavy Plate Iron Work, and a warehouse 40 x 80 feet, for the storage of Black and Galvanized Riveted Pipe. The firm recently completed a new three-story brick warehouse and removed the blacksmith shop to a larger site, equipping it for doing heavy forge work. They also contemplate the building of a furnace house and flanging department, in which will be installed modern appliances for doing this class of work more rapidly.

BIDS will be received until July 29 by the Supervising Architect at Washington, D. C., for a low pressure steam heating apparatus for the Post Office Building at Joliet, Ill., and until August 13 for a similar apparatus for the Post Office at Freeport, Ill.

ELIAS BERIA bid \$5622 and secured the contract for the plumbing work on the extension to the plant of the Crocker & Wheeler Company at Ampere, N. J.

THE CHANDLER PUMP COMPANY, Cedar Rapids, Iowa, inform us that they are building a new foundry 75 x 110 feet in size, also a new warehouse 50 x 154 feet, of two stories and basement. The company have in course of preparation a new catalogue which will be issued in a few days.

C. D. FISHER, representing the Board of Trade of Wapakoneta, Ohio, has closed a contract with a Chicago concern to establish their plant in Wapakoneta. They manufacture Acetylene Gas Generators, Stoves, Pans and other products, and in consideration of a bonus of \$12,000 and 15 acres of land they have agreed to establish a plant employing 50 men the first year and 100

men by the third year. It is announced that work on the plant will start at once.

THE NATIONAL TUBE COMPANY of Pittsburgh recently filled an order through a jobber for a considerable amount of Pipe for shipment to the Cape Nome gold fields. The quantity involved is said to have been 1800 tons.

THE trustees of the State Asylum for the Blind at Columbus, Ohio, will ask for bids on extensive improvements to the lighting, heating and plumbing systems of the institutions. Plans have been prepared by Stribling & Lum, architects. The improvements will cost about \$36,000.

THAT the "Glorious Fourth" is an institution worthy of celebration is a positive conviction with the Gurney Heater Mfg. Company, Boston, Mass., is evident in their act of sending to every contracting steam fitter a package of firecrackers with which to celebrate the day. *The Metal Worker* acknowledges the receipt of a package, and though the red paper cylinders show from the outside the inside rings with independence. The statement is made that the success of the house is due to independence of thought, ideas, action, design, construction and methods of manufacture and dealing which have become as dear to the trade to which they are devoted as is noise to the young American.

THE AMERICAN RADIATOR COMPANY, Chicago, are sending their compliments to the trade under a neat and attractive cover, grouping under the head of "Heating Advertisements That Aid," a number of electrotypes burdened with "catchy" facts, setting forth the merits of the hot water and steam radiating system, supplemented by extracts from scientific, medical and trade papers, among the foremost being *The Metal Worker*. Another catalogue, just issued by the company, calls attention to the advantages to be derived from the Acme Fire Box Boiler, entering into a history of the evolution of the Fire Box Boilers, and the principles of construction of the Acme, including the material used and the quality of workmanship in the manufacture of these Boilers, accompanied by instructive illustrations. Incidentally, the brick setting and Tank Heaters are considered and pertinent remarks made regarding chimneys and drafts. The catalogue is supplemented by a telegraph code of special interest to the trade in facilitating the transaction of urgent business.

New Firms and Changes.

THE UNITED STATES PUMP & SUPPLY COMPANY have been incorporated at Camden, N. J., with a capital of \$320,000, to manufacture Pumps, Wind Mills and Farming Implements. The incorporators are Roscoe Bean, George E. Pomeroy and Daniel J. Nysenande.

THE FEDERAL MFG. COMPANY, 1290 Old Colony Building, Chicago, are a new company organized to manufacture Plumbing Supplies. They will make a specialty of manufacturing a Faucet invented by Arthur O'Neill.

CAHILL & SMITH are a new firm at Pittsfield, Mass., composed of William Cahill, who has been plumbing inspector in the city, and Herbert Smith, another practical plumber.

THE RICHMOND PLUMBING & MANTEL COMPANY have been incorporated at Richmond, Va., with a capital of \$25,000, to do a general plumbing, gas fitting and electric wiring business. The officers are: J. Graham Davidson, president; W. T. Yarbrough, vice-president and general manager; H. T. Burnley, secretary and treasurer. The officers, with J. Temple and T. K. Sands, form the Board of Directors.

CARTER, ADAMS & Co. are a new firm in the plumbing business at 54 State street, Bangor, Maine.

GEORGE CURTIS has opened a plumbing shop in Gardiner, Mass.

HERBERT R. FITTZ AND CHARLES K. BARKER announce that they have succeeded to the plumbing, heating, tin and sheet metal business of the W. D. Parlin Hardware Company, Natick, Mass., under the firm name of Fittz & Barker. The new firm will continue the business at the old stand, 20 Main street, Natick. Both members of the firm have been connected with the old company for many years.

Sun Ray Boilers and Roman Radiators.

The J. L. Mott Iron Works, 84-90 Beekman street, New York, have just issued a 96-page catalogue printed on highly finished paper, covering the extensive line of boilers and radiators which they manufacture. The first 40 pages of the catalogue are devoted entirely to the Sun Ray boilers, made in a variety of sizes and series, principally of the vertical sectional return flue type, with grates varying from 20 inches to 48 inches in width.

A closer examination of the catalogue discloses two entirely new constructions. One is an improvement in construction on what is quite generally termed a "dog house" type of boiler. This boiler presents a large surface near the fire, from which the products of combustion rise into side flues and pass through a central return flue to the other end of the boiler and the outlet. These boilers are made with 19, 20 and 24 inch grates, the grates being increased in size with the number of sections used, and the boiler being of the push nipple construction. The other boiler is of the vertical sectional type, designed for large work, the construction providing back of the fire chamber for a bridge wall and a diving flue, with the view of utilizing to the greatest practicable extent the heat of the products of combustion. By an ingenious construction of the grate the fire in these large boilers can be kept in a live condition with a minimum expenditure of labor. The catalogue also shows a number of styles of small heaters and tank heaters, so that the Sun Ray line furnishes water heaters in capacities ranging from 100 square feet to 10,000 square feet of surface for hot water, or from 300 to 8000 for steam.

The latter part of the catalogue is devoted to radiators, the first place being given to Mott's Roman radiators, which are made in two and three columns in all heights. These are followed by fluted radiators and a plain two-column radiator. The Utility radiator is made with six columns, in heights varying from 13 to 26 inches, and is especially designed for use under windows. Another radiator is the Premier wall radiator in two sections, 12 x 24 inches. It is designed for connecting together so as to provide whatever amount of surface may be required. Concealed brackets for hanging radiators on a wall so as not to interfere with carpets or floors is another specialty. The catalogue presents views of corner, window, column, dining room and stair radiators, to show the variety of styles in which the goods can be furnished. Box bases for dampers for use in connection with radiators when they are used as direct indirect heaters are also shown, together with several styles of pin and prime surface indirect radiators.

In addition to radiator valves, expansion tanks and other steam fitting supplies, the Toby automatic water heater and steam traps are presented. The catalogue also contains a variety of useful information and gives full instructions for setting and operating boilers, as well as special information in reference to radiators and their tappings. A telegraphic code completes the catalogue.

Penn Radiator Catalogue.

A very convenient piece of trade literature devoted to the radiators made by the Penn Radiator Company, Corry, Pa., has just been issued by that concern. It is printed in two colors and consists of 64 pages, with a well arranged index. The front cover bears a picture of William Penn and the address of the house presented upon a green background. The catalogue opens with half tone engravings of the Penn two and three column radiators, followed by the Classic and Acme flue radiators. Illustrations are also given of the Gem, Pearl, Leader, Hercules and Brown radiators, with engravings showing the adaptation of the various radiators for direct indirect work. A variety of styles of indirect radiators are also presented. The radiators are shown arranged for windows, stairs and for use around columns. Interspersed with the text are half-tone engravings of a number of public buildings in various cities and country towns in which the company's radiators are used for heating.

Applications for Space at St. Louis World's Fair, 1904.

The Department of Manufactures of the St. Louis World's Fair of 1904 are now issuing, upon request, blank applications for space. These applications are designed to provide the exposition officials with information as to what establishments intend to exhibit, what the requirements of exhibitors are in regard to electricity, steam, gas, water, compressed air, sewerage, &c., and how much space is desired. The form to be filled out designates the following: Date of application, name and address of exhibitor, general nature of exhibit; dimensions of space desired, in length and width and total square feet; kind of space (wall or floor); description of exhibit, with scale drawn. The following questions are also asked in the form:

Is electricity, steam, gas, water or drainage required? (quantity and purpose must be specified).

Is intended exhibitor a manufacturer or a producer?

Are special foundations required? If so, full particulars.

Will intended exhibitor manufacture on space?

Is a concession to sell articles or products desired?

These applications, properly filled out and forwarded to the exposition authorities in St. Louis, will secure to all requests for space consideration in the order of their merit.

Those intending exhibitors, therefore, who respond promptly by filling out and returning applications sent them, can hardly fail to receive all that they need for a successful exhibit and will, in addition, thereby save considerable expense in their installations, as an increase in the time at command always means a decrease in cost of preparation. In the same way the efficiency of exhibits may also be materially increased as the best results in design and detail can only be obtained by the use of much thought and time. Many things, indeed, pertinent to a proper display of the processes, machinery or products of an exhibitor, depend upon the promptness with which application for space is made.

The filing of such applications implies no obligation; no pecuniary consideration enters into contracts for space. There is no charge for exhibition space. In fact, where practicable, every expense has been eliminated in order that the exhibitor may apply all of his appropriation in making an attractive and effective installation. Even power and light will be furnished free when in the judgment of the exposition authorities it is warranted.

The strike of metal polishers, buffers, platers and brass workers, which has been on in Cleveland for the past two months, has been declared off and the men returned to work on Monday of this week. The men struck for a nine-hour day and an increase in pay. By the terms of the agreement they will receive a nine-hour day or a 54-hour week, but the rate per hour remains as heretofore. The strike has been a bitter one and in several of the shops the men were enjoined from interfering with imported nonunion men. A large sum was paid out in strike benefits by the Polishers' Union.

David Randolph Morse of the firm of Howard & Morse, manufacturers of wire goods and ventilating appliances, at 45 Fulton street, New York, died on Saturday, June 28, at his home, 112 Fort Greene place, Brooklyn, N. Y. Mr. Morse was born in New Market, N. J., March 3, 1835. In addition to his membership in the firm of Howard & Morse he was connected with several financial institutions, and was a director of the Manufacturers' Association of New York. He was also a trustee of the Washington Avenue Baptist Church of Brooklyn.

We have received from Alfred E. Lister, secretary of the Scranton Engineers' Club, Scranton, Pa., a copy of the 1902 directory of the club, containing the names and addresses of the officers, committees and members, together with the charter, constitution, by-laws, &c.

THE LETTER BOX.

Inquiries in regard to practical questions of general interest are invited, in reply to which we shall be glad to receive suggestions and information from our readers.

Correspondents are requested in all cases to give their names and addresses, which will not, however, be published or disclosed without their consent.

PATTERNS FOR LEADER HEAD.

From G. W. G., New York.—Will you, through the columns of *The Metal Worker*, kindly give me a method how to lay out a leader head to given dimensions, as shown in the sketch, Fig. 1, in which A is the leader head, 9 x 11 inches at the top and 4½ x 4½ inches at the bottom. B indicates the flange, extending upward on the back. C indicates the opening out into the bottom, to which the tube D is connected, and E shows the leader partly broken, showing how the tube D enters into the same in practice.

Answer.—There are two methods by which this head can be laid out. The first, or more complicated, method is to first draw a plan view of the given dimensions; then establish a given profile on either the front or side views, and follow the principles given in Problem 80 in "The New Metal Worker Pattern Book." The second, and simpler, method, such as is generally used in shop practice, is shown in Fig. 2, which is drawn to a scale of 2 inches to the foot.

First draw the side view of the head, as shown by A B C D, making A B equal to the desired width, or 9 inches, B C to the required height, and C D to the de-

THE METAL WORKER

Patterns for Leader Head.—Fig. 1.—Reproduction of Correspondent's Sketch.

sired width of 4½ inches. Then draw the profile A D. In line with the side view draw the one-half front view, as shown by E F G H, making G H equal to one-half the width of the front view, or 5½ inches, and F E equal to one-half the desired width of 4½ inches, or 2¼ inches. Then draw the profile H 2' E. It will be noticed that owing to the difference in the projections the two profiles in front and side views are unequal.

To obtain the pattern for the front view proceed as follows: Divide the profile A D in the side view, as shown by the small figures 1 to 6. From these points, at right angles to B C, draw lines intersecting the profile H E in the front view from 1' to 6', as shown. Now extend the center line G F as shown by F M, upon which place the stretchout of the profile A D in side view, as shown by the small figures 1 to 6 on F M. At right angles to F M and from the small figures draw lines, which intersect with lines drawn parallel to the center line from similar numbered intersections in H E. Through the points thus obtained trace a line, as shown by 1 6 O N, which represents the half pattern for the front of the head to be formed after the profile A D in side view.

For the pattern for the side extend the line B C as shown by C P, upon which place the stretchout of the profile H E in the front view, being careful to transfer each space separately upon the line C P, as shown by points 1' to 6'. At right angles to C P and through the

small figures draw lines, which intersect with lines drawn from similar numbered points in the profile A D parallel to B C. Trace a line through intersections thus obtained, as shown by R S. Then will R S 6' 1' be the pattern for the sides, formed after the profile H E in

Fig. 2.—Front and Side Views and Patterns.

front view. J, in the side view, indicates the rear flange, shown by B in Fig. 1, and by G K L H in front view in Fig. 2.

The pattern for the back is pricked direct from the front elevation, one-half of which is shown by K L H E F G K. Trace the other half opposite the line K F.

WHOMAKESBRITANNIA METAL MOUTH-PIECES FOR BUGLES?

From James C. Gormly, 320 Third street, Macon, Ga.—Will you, or some of your readers, kindly advise me where I can buy britannia metal bugle mouthpieces, such as are soldered on to tin bugles and tin horns? I used to get them from the jobbers in tinnery supplies, but of late they seem to have stopped handling them and have been unable to procure them for me.

ARTISTIC ENAMELED RANGES.

From J. V., Pittsburgh.—On page 42 of *The Metal Worker* of June 21 I notice, in connection with a description of the Artistic enameled ranges, the following as a new process: "The method is to fuse the enamel with the steel under a very high temperature, the enamel penetrating the pores of the steel during the process and appearing on both sides" (I presume, of the metal).

Is this to be taken seriously? Fusion with glass or enamel simply means a slight change in the composition of the casting and considerably more slag. Of the original enamel nothing will be left. Stoves and ranges are enameled in the same manner as other sheet steel or cast iron articles. Glazed terra cotta or pottery effects require, aside of the ground coat, a white under glaze and a colored transparent top or surface glaze. Majolica enamels are applied in the same manner or for small castings can be directly sifted over the red hot metal, not requiring a second fire. For decorators' work in soft colors the specially prepared enamel paint is ground with gum and water, or some vegetable oil, and applied with a pencil like oil paint.

TRADE REPORT.

MARKET SUMMARY.

Pig Tin is dull and 1c. a lb. lower in price.
Copper is dull and unchanged.
Pig Lead is quiet and steady.
Spelter is very scarce and $\frac{1}{2}$ c. a lb. higher for small spot lots.
Antimony is quiet and unchanged.
Nickel is in good demand and without change in price.
Aluminum is firm and in good demand.
Tin Plates are quiet, with prices unchanged.
Black Sheets are firm, with large demand for Heavy Sheets.
Galvanized Sheets are rather dull and not so firm.
Scrap Iron is fairly active and firm.
Scrap Brass and Copper are dull and weak.
Scrap Zinc is $\frac{1}{8}$ c. a lb. higher.
Foundry Iron is very scarce and prices nominal.
Sheet Copper is in good demand and firm in price.
Sheet Zinc has not changed; demand is moderately active.
Hardware prices are strong in all lines, with advancing tendency in same.
Cast Iron Soil Pipe and Fittings were advanced 5 per cent. on July 1.
Malleable Iron Fittings have been advanced 10 per cent. from July 1.
Cast Iron Sinks, &c., are higher, former prices having been withdrawn by manufacturers.
Builders' Ranges have been advanced 5 per cent.
Solder has declined $\frac{1}{2}$ c. a lb.
Sash Weights have been advanced in price.
Tinware, in some of the leading lines, has been reduced 5 to 10 per cent. in price.
Lamp Wicks are quoted on uniform discount list.
Wire Nails are in good demand and prices firm.
Cut Nail prices have been reaffirmed for July; demand is lessening.
Window Glass is likely to advance in price.
White Lead is firm in price and rather quiet.
Linseed Oil is about $\frac{1}{2}$ c. a gallon higher.
Spirits Turpentine has declined 2c. a gallon, and is dull.
Scrap Rubber is dull and weak.

METAL MARKET.

NEW YORK, July 3, 1902.

Pig Tin.—There has been a steady decline in the price of Pig Tin during the week, owing to lower quotations from London and the East, together with heavy arrivals. The monthly statistics published on July 1, indicating heavy shipments from the Straits, tended to stimulate the downward movement of prices. Shipments from the Straits in the month of June were especially heavy, being 640 tons greater than in the same month of last year. The market closed weak and dull with very little business doing. Jobbers' prices rule about 1c. a lb. lower than those of a week ago, quotations on small lots of Straits Pig being $28\frac{3}{4}$ c. to $29\frac{1}{2}$ c. per lb. The monthly statistics published by the New York Metal Exchange show that on June 30 the visible supply of Tin was 1131 tons greater than at the same time last year. The statistics are as follows:

	Tons.
Total visible supply June 30, 1902.....	15,897
Against visible supply May 31, 1902.....	17,018
Against visible supply June 30, 1901.....	14,766

Charles S. Trench & Co., New York, publish the following American statistics of Pig Tin, under date of July 2, 1902:

	Tons.
Estimated stocks on spot, New York, Philadelphia and Boston, June 1, 1902.....	1,791

Actual arrivals during June, New York, Philadelphia and Boston, June 1, 1902..... 3,744

Total 5,535
 Estimated consumption during June..... 3,300

Estimated stocks on spot, New York, Philadelphia and Boston, July 1, 1902..... 2,235

Actual afloat from East Indies, shipments to July 1..... 3,103

Actual afloat from England and Holland, shipments to July 1..... 170

"Acara," ashore at Jones' Beach..... 90

Total visible supply, July 1, 1902..... 5,598

As against visible supply June 1, 1902..... 5,328

July 2, 1902, spot New York price Straits, $27\frac{3}{4}$ c.

June 2, 1902, spot New York price Straits, $30\frac{1}{2}$ c.

Copper.—The Copper market remains weak and dull, with prices throughout the week in buyers' favor. A slight attempt was made early in the week to start an upward movement, but before it was well under way the London market experienced a sharp decline, which checked the rise here. Buying is of very limited proportions and confined mainly to purchases for supply of immediate needs. Jobbers quote Lake Ingot in small lots at about 13c. per lb., and Casting Copper at $12\frac{3}{4}$ c. The total exportation for the month of June amounted to 12,560 tons, making the total exports since January 1, 93,943 tons, as against 49,325 tons of last year.

Sheet Copper.—The demand for Sheet Copper is referred to as of satisfactory proportions, and the volume of inquiry indicates a steady consumption of this material in the coming months. Prices continue firm on the basis of 18c. per lb. for Sheet Copper from store.

Pig Lead.—This metal is without change, the market being quiet and uninteresting, so far as actual transactions are concerned. The tone, however, continues steady and firm. American Pig in small lots is quoted at 4.45c. to $4\frac{1}{2}$ c. per lb. St. Louis advices indicate dullness as the ruling feature in the Pig Lead market at that point, with little or no fluctuation in prices.

Spelter.—The market for Spelter is remarkably firm, and prices are going right on up. There is considerable belief that the market is being manipulated by large New York interests. It is said that up to a certain point the recent advance was quite natural and looked for, but that beyond that figure the higher prices were induced by manipulation. Spot Spelter is exceedingly scarce, and in small lots rules about $\frac{1}{2}$ c. higher than last week, jobbers quoting the metal at $5\frac{3}{4}$ c. to 6c. per lb. for good Western brands. The demand, in view of the rapid advance in prices, is naturally very light. Moreover, the shutting down of plants for repairs has tended to restrict the demand. St. Louis advices report that a more active set of conditions has dominated the market for Spelter during the week, and transactions have been of considerable size, with prices extremely strong.

Sheet Zinc.—The demand for Sheet Zinc is of the average proportions, and prices are unchanged at $6\frac{3}{4}$ c. per lb. for 600-lb. cask lots, and $7\frac{1}{4}$ c. to $7\frac{1}{2}$ c. for smaller quantities.

Antimony.—This metal is firm and unchanged. Cookson's is quoted in small lots at $10\frac{1}{2}$ c. to 11c. per lb., Hallett's at $8\frac{7}{8}$ c. to 9c., and U. S. at $8\frac{1}{2}$ c. to $8\frac{7}{8}$ c.

Nickel.—There is no change in the market for this metal. Small lots are quoted at about 55c. per lb.

Aluminum.—The demand continues active, and prices are without change. Small lots of No. 1 Ingot, guaranteed 99 per cent. pure, are quoted at 37c. per lb., and 100-lb. lots at 35c.

Tin Plates.—The market for Tin Plates is absolutely without change. Business is dull in both wholesale and retail way, and it is not expected that any change in the direction of renewed activity will be seen for the next month or so. Prices, meanwhile, are steady and unchanged. American Bessemer Coke Plates I C, 14 x 20, in moderate sized lots, delivered at New York or corresponding points, are quoted by jobbers at \$4.75 to \$4.90 per box.

Sheets.—A heavy demand for the heavier gauges of

Black Sheets is reported, but the demand for the lighter gauges is somewhat quiet. Some good sized orders are said to have been placed for long deliveries, but the makers generally are not encouraging business of that kind at the prices buyers are willing to pay. Quite a number of the Sheet mills throughout the country are now closed for repairs and stock taking. Galvanized Sheets are somewhat dull. Jobbers quote No. 27 one pass cold rolled Soft Steel Sheets at 3.75c. to 3.80c., and No. 24 Galvanized at 4c. to 4.20c.

Chicago advices are as follows: With the exception of Heavy Sheets, which are firm, the market has been unsettled and prices somewhat irregular, Galvanized Sheets being especially weak. No. 27 Black Sheets in small lots from store rule at 3.45c. to 3.55c. Galvanized Sheets in small lots from store are held at 4.70c. to 4.75c. for No. 27.

Old Metals.—Scrap Iron prices are firm, although the demand is not quite as urgent as of late. Old Brass and Copper are dull and weak. Scrap Zinc is $\frac{1}{4}$ c. higher, owing to scarcity of new Spelter. Dealers are paying about the following rates for moderate sized lots, delivered at New York or corresponding points:

Heavy Copper.....	per lb.	10 c.
Light and Tinned Copper.....	per lb.	9 c.
Heavy Brass.....	per lb.	8 c.
Light Brass.....	per lb.	6 $\frac{1}{2}$ c.
Lead.....	per lb.	3 $\frac{3}{4}$ c.
Tea Lead.....	per lb.	3 c.
Zinc.....	per lb.	3 $\frac{1}{4}$ c.
Pure Aluminum Sheet.....	per lb.	22 c.
Cast Aluminum.....	per lb.	17 c.
No. 1 Pewter.....	per lb.	18 c.
No. 2 Pewter.....	per lb.	9 c.
Tin Plate Scrap, per gross ton.....		to \$5.00
Wrought Iron Scrap, per gross ton.....		\$13.00 to 13.50
Heavy Cast Scrap, per gross ton.....		12.00 to 12.50
Stove Plate Scrap, per gross ton.....		8.50 to 9.00
Burnt Iron, per gross ton.....		7.00 to 7.25

THE PIG IRON MARKET.

NEW YORK.—The situation is becoming more and more serious, with the strikes affecting many Eastern furnaces, some plants in Virginia and in the Ohio Valley, and now, too, in the Birmingham district. Consumers, the majority of whom are covered to the end of the year, are not getting the Pig Iron contracted for, and are forced to piece out as well as they can. In that way a good deal of Scotch, English and German Pig Iron is being purchased, and a good deal of it is being offered. For Scotch and English Foundry Irons, mixed, No. 1 and No. 3, \$20.50 to \$21.50 is asked, while for Scotch makers' brands, No. 1, \$22 to \$22.50 is paid. So far as we can learn very little is doing in this section for delivery in 1903, buyers preferring to await developments. It is difficult to quote American Pig Irons for nearby delivery, and the following figures are nominal: Northern Iron, at tidewater, No. 1 X, \$23.50 to \$25; No. 2 X, \$22.75 to \$23.50; No. 2 Plain, \$22.25 to \$22.50. Tennessee and Alabama brands are quoted as follows: No. 1 Foundry, \$22.50 to \$23.50; No. 2 Foundry, \$21.75 to \$22.50; No. 3 Foundry, \$21.25 to \$21.75.

CHICAGO.—Sales aggregating about 40,000 tons have been made of Northern Iron on the basis of \$21 for No. 2 Foundry, Chicago, for delivery during the first six months of next year. There has also been a considerable tonnage placed for deliveries beginning in November of this year and extending into the first four months of next year. But while the volume of business has been mainly in Northern Iron there have been further transactions in Southern Iron on the basis of \$17 for No. 2, Birmingham. The market for Southern Iron seems to be more settled, there being a tacit understanding apparently among Southern furnaces, but the report is current that a meeting is to be held to formally adopt \$17 as the basis of next year's delivery—that is, for the first half of the year. Thus far prices have ranged all the way from \$16.50 to \$18, transactions being actually booked at these prices. These fluctuations have crystallized into a steady market on the basis above quoted—that is, \$17 for No. 2. The general character of the market as far as spot and this year's delivery is concerned has changed but little. By some hook or crook dealers have been able to secure occasional lots ranging from carloads to 50 tons for quick shipment. This has

been especially true of Southern Iron, which has sold mainly at \$23.15 for No. 1, and \$22.65 for No. 2, delivery Chicago, but there have continued to be occasional transactions where excessive prices have been obtained.

PHILADELPHIA.—At no time within the past 25 years has it been as difficult to quote prices as it is to-day, and at no time has it been as difficult to guess what they will be two or three months hence as it is at the present time. Famine conditions are already in force, but if appearances are to be relied upon we shall be worse off later on. Fuel is getting scarcer and dearer every day, and now there are complaints of a car shortage, so that whichever way one looks prospects are not favorable for increased supplies or for lower prices. It is hardly possible to quote very close figures, because a sale at a price one day may be superseded by another a little later at an entirely different figure, so that either of the sellers looking at the other's quotations may say that the price is not correct, while, as a matter of fact, both represent actual transactions. A case in point is that No. 2 X Foundry Iron sold a few days ago at \$21.50 to \$22 for next year's deliveries, while to-day \$22.50 to \$23 is as well as could be done, with some sales at a medium figure. What it will be next week is hard to say. Fuel is practicably unobtainable, although pretty nearly double prices are paid for prompt shipments. To add to the complications, it is said that the railways are preparing for an advance in freights, so that the chances for lower costs for Pig Iron are simply out of sight. Foreign Iron is readily taken when it can be had with reasonable promptness, but there is still a strong indisposition to make forward contracts for Foundry grades. A fair average of prices for deliveries in buyers' yards or nearby points would be about as follows for deliveries during the last quarter of the year, July, August and September deliveries being anywhere from \$1 to \$2 higher:

No. 1 X Foundry.....	\$23.50 to \$24.50
No. 2 X Foundry.....	22.75 to 23.50
No. 2 Plain.....	22.25 to 22.50

CHICAGO REPORT.

Scrap Iron and Steel.—The closing of a majority of the mills in this section reduces the outlet for Scrap at the present time, but the supply is not large, and as some of the mills will resume within two weeks there is but little change in the temper of the market and prices remain steady, as previously quoted. Dealers buy offerings in carload lots, Chicago delivery, as follows:

	Per net ton.
Country Wrought Scrap.....	\$14.00 to \$14.50
Machinery Cast.....	to 13.50
Malleable Cast.....	12.00 to 13.00
Stove Plate (free from burnt).....	to 9.50
Burnt Iron and Grate Bars.....	8.00 to 9.00
Sheet Iron and Hoops.....	8.00 to 9.00
Plow Steel.....	12.00 to 13.00
Breaking Stock.....	to 11.00
Old Boilers—whole (Iron).....	9.50 to 10.00
Old Boilers (Iron) cut in single Sheets and Rings.....	12.00 to 12.50
Old Gas Pipes and Boiler Tubes.....	12.00 to 12.50
Cast Borings.....	8.50 to 9.00
Turnings.....	12.00 to 12.50
Horseshoes.....	14.00 to 14.50

Old Metals.—The Scrap Copper market has been again weak in sympathy with Ingot Copper in primary markets. Prices have been somewhat easier and Red Brass Borings have declined $\frac{1}{4}$ c. Pewter, too, has been more freely offered, and No. 1 has declined 1c.; on the other hand, Zinc has developed a stronger tone and prices have advanced $\frac{1}{4}$ c. per lb. The following prices are being paid by dealers in this market:

	Per lb.
Copper Wire and Heavy.....	10 $\frac{3}{4}$ c.
Copper Bottoms.....	9 $\frac{3}{4}$ c.
Copper Clips.....	10 $\frac{1}{2}$ c.
Red Brass.....	11 c.
Yellow Brass.....	8 $\frac{1}{4}$ c.
Red Brass Borings.....	9 $\frac{3}{4}$ c.
Yellow Brass Borings.....	7 $\frac{1}{4}$ c.
Light Brass.....	6 $\frac{3}{4}$ c.
Pipe Lead.....	3.70c.
Tea Lead.....	3.35c.
Zinc.....	3 $\frac{1}{4}$ c.
Tin Foll.....	22 c.
Pewter, No. 1.....	18 c.
Pewter, No. 2.....	11 c.
Aluminum.....	20 c.

Old Rubber.—There has been a fair demand, and with offerings only moderate the market has continued

to develop firmer feeling. The price of Air Brake Hose has advanced \$3 per ton. The following are the prices paid by dealers in this market:

	Per net ton.	Per lb.
Garden Hose.....	\$25.00
Air Brake Hose.....	45.00
Rubber Shoes.....	1 c.
Rubber Car Springs.....	5 c.
Inside Bicycle Tubing.....	22 c.
Outside Tubing.....	6 c.
Black Rubber.....	4 c.
White Rubber.....	8½ c.

Rags.—The market is slow and easy, with free offerings and prices are barely sustained. Dealers buy desirable offerings at 65c. to 75c. per 100 lbs., Chicago delivery.

Anthracite Coal.—Beyond the reduction of discount of 10c. per ton, the market has changed but little during the week and the demand has been unusually light. Supplies are being gradually reduced, however, and under the circumstances the market gradually hardens. There continues to be a fair movement of contracts and the prices current are as follows, subject to a discount of 20c. per ton for shipments made during the month of July:

	Grate.	Egg and Stove.
Chicago	\$5.75	\$6.00
Milwaukee, Wis.....	5.75	6.00
St. Louis.....	6.20	6.45
Kansas City, Mo.....	8.25	8.50

THE HARDWARE TRADE.

The last half of the year opens with a very general feeling of confidence that the remaining six months will be characterized by excellent business. All classes in the trade have gratifying reports to make in regard to results of the past six months, which have been undoubtedly a period of exceptional prosperity both in the making and marketing of goods, as well as throughout the country at large. There is general agreement in the feeling that there is still a large volume of business awaiting the trade during the remainder of the year. The strength of the iron market gives firmness to prices, but the heavy demands upon manufacturers have perhaps nearly as much influence in this direction. At the present time there is difficulty in obtaining goods in many lines which is without parallel in recent years. Prominent manufacturers who have usually been in a position to fill orders promptly are months behind. Not only in heavy goods, but in many other lines, such as Shovels, Tools, Builders' Hardware, miscellaneous specialties and various kinds of Shelf Hardware, is there delay in executing orders. With the excellent promise for business in the fall there is some prospect that in many lines it will be a question as to obtaining goods rather than of prices, and merchants who take this view are covering their requirements liberally. In this condition of things prices are naturally steady, and apart from the increased cost of goods on account of the prices of the raw material and the higher wages which are ruling, manufacturers are indisposed to make concessions. In a few lines, however, the effect of competition is developing slightly lower prices, but on the whole the situation is very satisfactory.

NOTES ON PRICES.

Cast Iron Soil Pipe and Fittings.—Under date of July 1 the manufacturers of Cast Iron Soil Pipe and Fittings announced new prices to the jobbing trade. They also agreed between themselves that hereafter all sales at jobbers' prices are to be confined to the "blue list" of jobbers issued by the National Confederated Supply Associations, and that all sales to other persons or firms must be at prices adopted by the Association of Manufacturers. The new prices adopted at the Niagara Falls meeting show an advance of 5 per cent. over the prices in effect since April 1 last. The prices to the plumbing trade in the territory of Greater New York and the surrounding diistrict remain unchanged. Up to the present writing none of the jobbing houses have advanced their selling price. This, we believe, is due to the fact that business in the metropolitan district is exceedingly dull,

and the demand for Soil Pipe and Fittings in particular does not warrant any change. It is also said that the price of Cast Iron Soil Pipe and Fittings is so near to the price of Wrought Iron Pipe that with the difference in the labor it might be an inducement on the part of the builder to use Wrought Iron Pipe for drainage purposes. Terms and freight allowances remain unchanged.

Malleable Iron Fittings.—Under date of July 1 the manufacturers of Malleable Iron Fittings withdrew prices and announced that an advance of 10 per cent. had taken place on that date. Recent changes in the wages of the workmen and a continued advance in the price of raw material are responsible for the change. It is said that all the principal manufacturers of Malleable Fittings are simply overwhelmed with orders. One of the largest of the Pennsylvania manufacturers is still several months behind on last year's business. Orders are coming in to the manufacturers at such a rate that they are almost impelled to put prices at a prohibitory point in order to relieve themselves of the present tax on their capacity.

Cast Iron Sinks.—Owing to the increased cost of all raw materials that enter into the manufacture of Cast Iron Sinks, Sink Backs, Legs, Cesspools and goods of a similar character the manufacturers say that they are forced to withdraw all prices. New prices will be furnished only on application, specifications to accompany the application for new prices. All quotations will be made for prompt acceptance and immediate shipment.

Solder.—The decline this week in the price of Pig Tin has been followed by a reduction of about ½ cent a pound in the price of Solder. Half and Half, Guaranteed, is quoted in small lots at 19½ to 20 cents, and No. 1 at 17 to 18½ cents.

Bifurcated and Tubular Rivets.—The manufacturers of Bifurcated and Tubular Rivets announce a reduction in price of these goods, which is understood to be owing to the development of competition.

Sash Weights.—Going into effect July 1 the price of Sash Weights for the Eastern district is made \$22.50 to \$23 per ton, f.o.b. foundry. It is not unlikely that a similar advance will be made in the West, but we are not in receipt of advices in regard to it.

Tinware.—The manufacturers of Tinned, Stamped, Pieced and Japanned Ware have readjusted some of their prices on a comparatively few lines of leading goods. The changes are principally in the line of reductions, although there are a few increases in price. The reductions will vary between 5 and 10 per cent., and are mainly on account of some increased competition among smaller manufacturers of competitive goods. It is in no sense a general revision of prices, although the goods affected are thoroughly staple.

Lamp Wicks.—Manufacturers of Lamp Wicks have adopted uniform discounts on Regular, Special and Stove and Heater Wicks. The list on Regular Wicks is known as List No. 1; on Special Wicks, as List No. 2, and on Stove and Heater Wicks, as List No. 3. Discounts are as follows:

	Discount.
List No. 1.....	70 and 5 %
Lists Nos. 2 and 3.....	10 and 5 %

List No. 1 is as follows:

	Per gross.
No. O, or E, ½ inch wide.....	\$0.60
No. 1, or A, ⅝ inch wide.....	.75
No. 2, or B, 1 inch wide.....	1.10
No. 3, or D, 1½ inches wide.....	1.75
Brilliant, Argand and Crystal Light.....	2.00
Deitz, ¾ inch wide.....	.90
B. Wick, Double Thick.....	2.50
Above Wick in 32-yard pieces at same prices.	
Pett Circular.....	.60
No. 3, Moehring, 2¾ inches wide.....	3.00
Mann's Monarch.....	2.50
D, Dual, 10 inches long.....	3.00
Duplex and Oxford, 10 inches long.....	3.00
Wide-Awake and Nutmeg.....	.50
Tom Thumb, Round and Flat.....	.30
Nos. 1 and 2, German Student.....	1.10
Little Banner, Favorite and Evening Star.....	.30
Round Fluid, per dozen.....	.60 cents.

List No. 2 pertains to such Wicks as are used on Roch-

ester, Miller and other lamps of that type. List No. 3 relates to Flat and Round, Stove and Heater Wicks. As all manufacturers do not make Wicks for the same lamps, stoves and heaters, Lists Nos. 2 and 3 are not altogether uniform, but all Nos. 2 and 3 lists are subject to the same discounts as given above.

Wire Nails.—The demand for small lots of Wire Nails from store is good and prices are unchanged at \$2.30 per keg. The mills are closing for repairs, thus reducing the output of Nails.

Cut Nails.—Prices of Cut Nails ruling in June were reaffirmed for the month of July by the Cut Nail Association at a recent meeting. The material falling off of demand at this season will afford some relief from the delays in obtaining both Steel and Iron Nails. Cut Nails are in fair demand in the New York market at unchanged prices. Small lots from store are selling at \$2.30 per keg.

Glass.—All Window Glass factories are now reported as being out of operation. There is said to be considerably less Glass in manufacturers' and jobbers' hands than there usually is at this season, so as stocks become depleted in assortment higher prices may be expected for popular sizes. The Jobbers' Association quotations for Single and Double Strength Glass from store is 88 and 5 per cent. discount.

White Lead.—The demand for White Lead in Oil shows a falling off, as the trade are pretty well supplied. Manufacturers are now busy preparing for trade in the fall. Prices are unchanged. Small lots from store are quoted at 6½ to 6¾ cents per pound.

Linseed Oil.—Demand for Linseed Oil for immediate delivery is of a hand to mouth character. There is also little interest taken in placing contracts for large lots of Oil for future delivery. Prices are firm, and higher. City Raw, in small lots, is quoted at 68 to 68½ cents per gallon.

Spirits Turpentine.—A falling off in the price of Turpentine during the middle of the week revived interest in the market, which had been dull at previous figures. Buying was in more liberal quantities, at the lower figures. Jobbers' prices for small lots of Turpentine, from store, are 48 to 48½ cents per gallon, or about 2 cents lower than last week's figures.

Old Rubber.—The market is dull and rather weak. Dealers in New York and vicinity are paying about the following figures:

Car Springs, ton lots, per lb.....5c.
Rubber Shoes, less than carloads, per lb.....6¾ to 7c.
White Wringer Rolls, per lb.....7c.
Inside Bicycle Tubing, per lb.....21½c.
Outside Tubing, per lb.....6c.

TRADE NOTES.

THE BENEDICT & BURNHAM BRASS & COPPER COMPANY, Chicago, have increased their capital stock from \$100,000 to \$150,000.

THE HYLE BROTHERS STEEL COMPANY, established at Syracuse, N. Y., last year, will be enlarged and the capital increased to \$3,000,000. The company are contemplating the erection of a plant to employ 500 men in the manufacture of Die Stocks, Pipe Cutters, Tube Expanders and other hard steel tools.

The employees of the Kilbourne & Jacobs Mfg. Company, Columbus, Ohio, have organized a St. Louis exposition club, the object of which is to provide a fund for defraying their expenses at the St. Louis World's Fair in 1904. Each member contributes \$1 per week to the fund.

THE AERMOTOR COMPANY, Chicago, Ill., report business better than ever before. They find themselves hard at work to keep within sight of orders, although they are running their plant until 9 o'clock at night.

THE CENTRAL CITY BRASS MFG. COMPANY, Syracuse, N. Y., will enlarge the capacity of their foundry.

THE PENNSYLVANIA FIRE PROOFING COMPANY of St. Mary's, Pa., have been chartered with a capital of \$150,000. E. D. Carter of Erie is treasurer.

THE CARBORUNDUM COMPANY of Niagara Falls, N. Y.,

are about to build a large addition to their crushing and grinding plant. This addition will be in the form of a three-story brick building, 50 x 225 feet. During the year other additions and improvements will be made.

THE STAR ALUMINUM COMPANY of Doylestown, Ohio, have increased their capital stock from \$10,000 to \$15,000 and will make a number of improvements to their plant.

THE YOUNGSTOWN BRONZE COMPANY, recently organized at Youngstown, Ohio, will manufacture Bronze, Brass and small Gray Iron Castings. Officers have been elected as follows: Graut S. Jones, president; J. W. Long, vice-president and superintendent, and W. H. McMillin, secretary and treasurer.

An agreement has been reached between the foundrymen and the molders of Pittsburgh. An advance of 10 per cent. in wages was asked by the latter, but after two days' conference an advance of 20 cents a day was agreed upon, to be in force for one year from July 1, 1902. The agreement involves all the leading foundry concerns in Pittsburgh.

PERFORATED METALS
OF EVERY DESCRIPTION
FOR SCREENS OF ALL KINDS
THE HARRINGTON & KING PERFORATING CO.
217 NORTH UNION STREET.
CHICAGO, ILL., U. S. A.

STEEL, IRON, COPPER, ZINC, BRASS, TIN,
AND ALL OTHER METALS
PERFORATED AS REQUIRED
FOR
GRAIN CLEANING AND MINING MACHINERY,
WOOLLEN, COTTON, PAPER AND PULP MILLS,
RICE, FLOUR AND COTTON SEED OIL MILLS,
SUGAR AND MALT HOUSES, DISTILLERIES, FIL-
TER PRESSES, STONE, COAL AND ORE SCREENS,
BRICK AND TILE WORKS, FILTERS,
SPARK ARRESTERS, GAS AND WATER WORKS,
OIL, GAS AND VAPOR STOVES,
COFFEE MACHINERY, &c. &c.
STANDARD SIZES PERFORATED TIN AND BRASS ALWAYS IN STOCK.
NEW YORK OFFICE: 114 LIBERTY STREET

TINSMITHS HELPER and PATTERN BOOK

WITH USEFUL RULES,
DIAGRAMS and TABLES
= By H. K. VosBurgh =
NEW AND IMPROVED EDITION

A USEFUL hand-
book for tin-
ners and other
mechanics, treat-
ing simple prob-
lems in pattern
cutting, such as
are of daily occur-
rence in the shop.
An elementary
manual for the
young tinsmiths
A handy reference
for all sheet metal
workers.

120 Pages
53 Figures

An Invaluable . . . \$1.00
Pocket Companion . . .

Section 1 ~ Pages 1-66 Diagrams and Patterns

Demonstrates in a simple way, and by means of illustrations and descriptive text, about 50 examples of sheet metal pattern work, such as the method of cutting can breasts, flared tinware, scale scoops, oval boiler covers, lips for measures, elbow patterns, &c.

Section 2 ~ Pages 69-88 Epitome of Mensuration

Compiled with regard to the requirements of the tinner, describing how to find the area of a circle, the circumference of a circle, the contents of a sphere, a cylinder, a cone, and other information relating to the work of a tinsmith.

Section 3 ~ Pages 89-120 Tables, Rules, Recipes

Gives tables of the weights of sheet metals, including the weight of black sheet iron, sheet lead, and galvanized iron sheets with their dimensions; the weight of lead pipe per foot; the weights of tin plates, sheet copper and sheet zinc. Several pages are devoted to tables giving the areas and circumferences of circles, the capacity of cans, the number of barrels in cisterns and tanks, sizes of tinware in form of frustum of a cone, &c., and practical receipts, including mixtures for solders of different kinds, soldering fluxes, and various cements.

Cloth Bound, \$1.00 Postpaid

"BOSS" WASHING MACHINES.

Trade-Mark.

Closed View.

Illustration of the latest improved "BOSS" double action and rub board washing machine. Has all gearing enclosed and other important improvements.

SIZES: { 7, 8, 9, wood frame lower cylinder.
10, 11, 12, steel frame lower cylinder.

We are also the patentees and manufacturers of the following:

- The Boss Internal Gear Washer,
 " " External " "
 " New Boss Rotary " "
 " " Champion Rotary " "
 " " Standard Champion " "
 " Standard Perfection " "
 " Banner Washer and
 " Improved Standard.

The washers are carried in stock in carload lots in all the principal cities. Write us and we will quote you prices and at same time advise you as to where and from whom you can obtain them from stock, thereby, perhaps, saving extra cost of freight, than when shipping from factory. These washers are carried in stock under jobbers' special brands, but none are genuine without our name and address appearing on each machine. Write for one of our beautifully illustrated and descriptive catalogues, mailed free upon application.

THE CLASON
Architectural Metal Works.
PROVIDENCE, R. I.

**Art of
Coppersmithing.**

A Practical Treatise on Working
Sheet Copper in all Forms.

By **JOHN FULLER, Sr.**

327 Pages, 474 Illustrations, 7 x 10
Inches, Cloth. Price, \$3.00.

This work, prepared at great labor and expense, is reproduced from *The Metal Worker*, and forms an exhaustive treatise on the Coppersmiths' Art, being the only volume on that subject that has been published. It is beautifully illustrated with 474 pen and ink drawings, and is bound and printed in the best manner.

CONTENTS

Historical Sketch of Copper; Braziers' Art, or Light Coppersmithing; First Year's Experience; Repairing and Tinning; The Boy's Second Year; Making Washing Coppers; Making Small Brewing Coppers; Table of Dimensions and Capacity; Making Hand Bowls; Making Frying Pans; Making Closet Pans; Making Water Balls; Mounting for Copper Goods; Glue Pots and Tea Kettles; Oval Tea Kettles; Beer Mullers; Funnels; Coffee Pots; Saucepans and Pudding Pots; Stewpans; Stock Pots; Fish Kettles; Brazing Pans; Tea Boilers; Warming Pans; Preserving Pans; Dripping Pans; Coal Scoops and Coal Hods; Making Coal Scoops; Planishing and Smoothing; Cranes or Syphons; Pumps; Appliances of Railway and Marine Coppersmiths; Making Copper Pipe; Piecing and Joining Pipes; The Fire Pots; Fire Pot Set for Brazing Joint; Soft Soldering Large Joints; Taking Templates; Filling and Bending; Making Bends; Template Boards; Patching Pipes; Outlets; Expansion Joints; Tee Pieces; Three-way Pieces; Cross or Four-way Pieces; Saddle Fire; Marine Work; View of Maudsley, Sons & Field's Shop; Making Large Bends; Making Double Bends; Brazing on Flanges; Short Bends; Air Pipes for Ships; Making Hollow Spheres; Brazing Sheet Brass; Locomotive Brass Work; Brass Dome Covers; Heavy Pipes for Breweries; Brewing Coppers or Kettles; Dome Coppers; Dome and Pan Coppers; Tallow Coppers; Dyers' Coppers; Sugar Tieches; Stills.

Sent post-paid upon receipt of price.

Iwans' Perfection Wire Conductor Pipe Hanger.

Best Hanger Ever Invented.

Why It Is The Best:

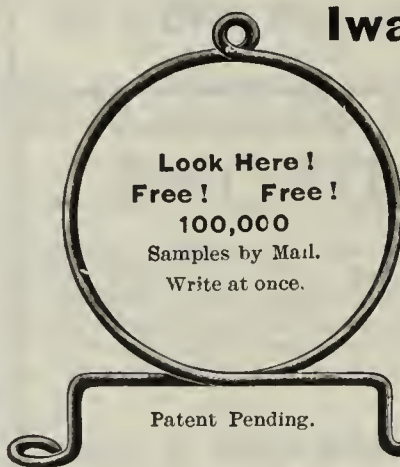

- 1st. It holds pipe one inch from building to permit painting.
- 2d. It looks ornamental.
- 3rd. It can be used for frame or brick buildings.
- 4th. It can be used for round or corrugated pipe.
- 5th. It completely encircles the pipe, holding it firmly on all sides.
- 6th. It is strong and durable.
- 7th. It is cheaper than any other hanger.
- 8th. A tinner can put up more pipe in less time than with any other hanger.

The hanger can be tightened as desired by giving the eye a twist. For 2-inch corrugated pipe 2 1/2 inch hanger is required. Other pipe runs uniform.

Also Manufacturers of Iwans' Chimney Top.

THE WHOLE SHOW.

When it comes to the matter of artistic harmony "Berger's Classik" is just about "the whole show" in the metal ceiling line. No other line of Metal Ceilings possesses the artistic harmony and beauty of "Berger's Classik." No other line of Metal Ceilings has anywhere near as great a variety of patterns to choose from. "Berger's Classik" Metal Ceilings are made in a series of complete classified designs, each composed of pieces that harmonize with each other. "Berger's Classik" Metal Ceilings have the rare combination of mechanical excellence, high grade stamping and artistic beauty which give them the preference with high grade trade. Don't do yourself or your customers the injustice of trying to sell them ceilings that are artistically wrong.

SELL THEM

The New Metal Worker Pattern Book.

425 Pages. 744 Illustrations.
Size 10 x 13 Inches.

A new treatise on pattern cutting as applied to all branches of sheet metal work.

Cloth Bound, Price \$5.

This work contains a collection of 218 problems and an elaborate explanation of the principles of pattern cutting, including Triangulation.

It embodies the problems of the former Metal Worker Pattern Book, all of which have been revised, and many of which have been entirely rewritten and solved by more approved methods. To these have been added 75 new problems and much other new material and explanatory matter, making this work a model of completeness in every respect.

ARRANGEMENT.

In point of arrangement the new work far surpasses the former one in that the problems are classified under three different heads, and simply indexed, and also that by means of a table of contents any required department of the work can be easily found.

CONTENTS.

While Chapter VI, comprising the greater part of the work, is devoted to the solution of problems, the five preceding chapters thoroughly explain the principles of pattern cutting, and place the student in possession of the preliminary information necessary to a thorough understanding of the subject.

SUMMARY OF CONTENTS.

- I. Terms and Definitions—15 pages.
- II. Drawing Instruments and Materials—13 pages.
- III. Linear Drawing—6 pages.
- IV. Geometrical Problems—35 pages.
- V. PRINCIPLES OF PATTERN CUTTING—25 pages.
- VI. PATTERN PROBLEMS (3 Sections)—325 pages.
 1. MITER CUTTING,
 2. FLARING WORK,
 3. TRIANGULATION.

All Tanners, Cornice Makers and Sheet Metal Workers should be provided with a copy of

The New Metal Worker Pattern Book.

Our *Improved Eureka Cornice Brake*. Will bend No. 20 iron. 96 inches long.

CORNICE MAKERS' SQUARING SHEARS. With Lever Arc, Automatic Gauge. Will cut No. 2 iron, 97 inches long.

HERCULES SHEARS

make the cutting of sheet metal of heavy gauges an easy task for the mechanic and a profitable operation for the employer. With them a man can cut No. 12 steel with one hand on the lever, leaving the other hand free to guide the stock while cutting elbows, ties and circles, as small as 8 inch radius; this is done without burring or buckling either piece, thus avoiding hammering and straightening, which add to the cost of the product. They split sheets of any width or length up to No. 12 gauge, cut wire or bar-steel $\frac{1}{8}$ inch thick, cut off and mitre angle iron $\frac{1}{8}$ inch thick, and do it perfectly.

★ SAWS ★

Our Star Hack Saws are now used in nearly all Iron-working Shops the world over. They are equally useful for farmers and men in all departments of life. They will cut iron and wood equally well. A nail does not dull them at all. One blade, which costs five cents, will cut off an inch square bar of iron 200 times with out sharpening. We have cut off such a bar 337 times with one blade. All hardware dealers will furnish these saws. If not, we will send one steel frame and six blades by mail, prepaid, on receipt of \$1.00.

All good blades are stamped with a ★
MILLERS FALLS CO., 28 Warren St., N. Y.

— "ARE you suffering from cold?"

"No. My trouble started with a cold, but I took all the remedies my friends prescribed and they are what I am suffering from now."—Exchange.

— ONE INSTANCE.—"Thomas," said the teacher of the class in physiology, "can you give a familiar instance of the power of the human system to adapt itself to changed conditions?"

"Yes'm," responded Tommy Tucker. "My Aunt Abigail gained a hundred pounds in flesh in less 'n a year, an' her skin didn't crack a particle."—Chicago Tribune.

Sectional Fire Pot

WITH EXTENDED FIRE SURFACES.

It saves *expense* of a whole fire pot when *only half* is required. The *wings* on the fire pot *vastly increase the radiation*. The air is *quickly and evenly heated* as it passes from

the cold-air duct to the hot-air chamber. These wings strengthen the fire pot and prevent its warping.

ROUND OAK STANDARD OF AMERICA

How many times it happens
that the furnace man
who knows better
is beguiled into
placing the furnace
cold and warm air ducts
where the lady of the house
wishes them—instead
of standing up
for what he knows
to be the right way.

He fears to lose
the sale, of course
and there is one cause
of so much
bad furnace work.

When our advice is asked
and we make the plan
we insist upon its
being "set" our way.

If any changes are projected
we do not ship the furnace.

Moore's Stoves

*Blow your Horn, (we do)
When you have fish to sell, (we have)*

Says the old adage, and that's why we do so much horn blowing about our

Quick Oven Steel Cook Stoves

We originated this kind and were the only makers for several years. Thereby we gained *early* experience in the ways in which good steel cook stoves should be made. Our constant improvements in this direction easily keep Moore's by long odds the favorite. Messrs. John Guff & Company, Williamsville, Iowa, write under recent date:

"We wired you to-day for six more Medal Cooks same as last. Get them to us quick Last lot came in a week ago and are all gone. It's the only stove selling around here."

This tells the story.

WORK WELL DONE AT LITTLE COST

SOMETIMES

a furnace costs little but makes up the cheapness in the quantity of coal it consumes; sometimes a furnace costs a great deal and the extra cost is made up by the saving of the fuel; sometimes a furnace costs a moderate price and does the work well and saves fuel.

A FURNACE

of the latter class is shown here-with, and our catalogue shows it more thoroughly.

Here is the experience of one man with this style of furnace:

L. J. CLARK, Villas, Pa., says:

"I want to tell you how my furnace acted one winter. Down stairs I heat 3 rooms and pantry and hall, using a gasoline stove for cooking; upstairs I heat 3 bedrooms, bathroom and hall, and also have one register in attic, which was used occasionally, making in all 10 registers. I moved into the house on the 4th of November and had fire up to the 5th of May. I bought 8 tons of soft coal at \$1.80 per ton, total \$14.40. I had about 1 1/4 tons left over. We had loads of hot water heated in furnace, so that fuel for gasoline stove only cost about \$2.10. This looks rather small for expense, but nevertheless it is a fact."

WINCHESTER

This is a strange world, yet that is no reason why you should be a stranger to the admirable points of a "WINCHESTER" heater. Become acquainted with it, and you will be, not a stranger, but a close friend. Smith & Thayer Company, Boston, Mass.; 105 Beekman St., New York.

HEATER.

You Must Win Out.

The department stores win out because they cater to all classes of trade. You may do the same thing with

"GURNEY" HEATERS,

BRIGHT IDEA 400 SERIES and DORIC.

For heating large buildings, halls, etc., we furnish "Bright Idea." For heating smaller buildings, residences, greenhouses, etc., "400 Series," and for dwellings, "Doric" Heaters. Thus you don't have to pass by any want. You can bid on them all—and successfully, too, because "Gurney" Heaters **will accomplish more at less cost than any heater made**. Based on actual value, it's easily the cheapest one in the market. Catering to all classes of heating wants

and possessing these marked excellences, you must win with a "Gurney" agency. Write for full particulars and latest catalogue

IF YOU ARE NOT SELLING THE

Peck-Williamson Underfeed Furnace

you have not the trade and are not making the money you might. Just a pull or two of the lever feeds the new coal from underneath.

The Underfeed Furnace consumes less fuel than any other furnace ever built. The coal is burnt more slowly. All the heat units from it, as well as from the smoke, are utilized and all smoke eliminated.

Our handsome booklet explains its splendid heating qualities and coal saving.

You may have this booklet and our special plans for selling. Ask for booklet about our Laundry Dryer also.

Some Ripe Experience

Has come to us through watching the doings of dealers throughout the United States.

We find that the dealer who sells cheap furnaces not only loses ground in the furnace business but also has a falling off in his other lines.

On the other hand, we can say that the man who sells a good furnace and charges enough to do a good job will, in a few years, be the leading furnace man in his town and at the same time build up his other business.

The *American Furnace* is made for the better class of trade; is durable, clean and economical in fuel.

OAKLAND, ME., June 9, 1902.

R. W. DRUMMOND, Esq., Fargo, N. D.

Dear Sir:—Yours at hand and, in reply, will say I put in a "**Dighton**" Furnace in my store in the Fall of 1899. It gives us the best of satisfaction. We heat a store 36 x 40 and use from six to seven tons of coal.

It cost us \$62 to put the "**Dighton**" in and the same kind of a Furnace in any other make would have cost us from \$25 to \$40 more.

You will make no mistake if you invest in a "**Dighton**."

Yours truly,

J. H. MORSE.

NEW YORK. CHICAGO. LONDON.

A Tea-Kettle Boils Quicker on my Chimney than on my Stove.

A fire in a red glow represents 1200 degrees of heat, a draft through this carries the heat out of the chimney unless intercepted by a cross tube **Rochester Radiator**, when nearly all this waste heat is conveyed into the room by the rapid circulation of air through the tubes and saved. This appeals to common sense and is verified by the most thorough scientific test.

The **Rochester Radiator** is a satisfactory article to sell and one that affords the dealer a good profit.

ROCHESTER RADIATOR CO.,

KITCHEN BOILER CONNECTIONS.

A SELECTION OF
Practical Letters and Articles
Relating to Water Backs and
Range Boilers.

FIFTH ENLARGED EDITION.
184 Pages, 113 Illustrations, 6 x 9 in.
Cloth Bound.

Price, \$1.00, Postpaid.

Press Notices of First Edition :

The book is a practical helper to every member of the plumbing trade, who, being alive to his own interests, should embrace this opportunity to obtain the valuable instruction in which the work abounds.—*New England Stove, Hardware and House Furnisher.*

The *Metal Worker* produces in this volume a number of queries, with answers thereto, which have appeared in that paper. It will be seen that any plumber who is troubled to make boilers work satisfactorily will here find his troubles alleviated. It contains numerous illustrations and throughout is highly practical from the standpoint of the plumber. It contains a table of contents and an index.—*Scientific American.*

Both interesting and instructive to our trade. It shows how mistakes are apt to arise and how they may be overcome.—*Plumbers' Trade Journal.*

The publisher of this work is well known for his former successful efforts in the publication of useful and thoroughly practical books for metal workers and steam fitters. The book before us is a model of its kind in judicious compilation, practical instruction, neat illustrations and general typographical appearance.—*The Master Steam Fitter.*

The book is well got up and the information well given. Those interested in works of this character will do well in buying it.—*The Plumber and Decorator.*

Can be considered an authority on the subject to which it relates.—*American Engineering.*

Nearly every problem is illustrated fully and this interesting question of water back connections will be found to be quite fully treated in the volume.—*Domestic Engineering.*

ABOUT ESTIMATE BOOKS

For Plumbers and
Heating Men

Your Contract and Estimate Record Book for Plumbers is one of the best books that ever came into our house and we would not be without it for three times the amount it cost. We can figure without omitting anything with accuracy at a very short time. We think that every plumber should not be without this valuable book.

W. C. BENNETT & CO., Haverhill, Mass.

We have used an estimate book for three years and could not do without one. Would say that yours is far superior to any yet used and can cheerfully recommend it.

W. R. PARK & SON, Taunton, Mass.

A great advantage. Prevents the leaving out of small items, which amount to more than the cost of the book in a very short time.

CHAS. W. COOMBS, Lawrence, Mass.

Your Contract and Estimate Record Book has been of great use to me in both the saving of money and labor, and I would highly recommend it to any or all master plumbers.

THOMAS P. DOHERTY, Taunton, Mass.

These testimonials are a few of many, and indicate both that a well arranged estimate book, which provides complete lists of items to be figured upon, is a time, labor and money saver, and that the "CONTRACT AND ESTIMATE RECORD BOOKS" come up to this requirement.

THE EDITIONS ARE AS FOLLOWS:

CONTRACT AND ESTIMATE RECORD BOOK FOR PLUMBERS

OFFICE EDITION.

200 Pages. Arranged for 100 Estimates.
Size 8 x 11 inches. Cloth bound, **\$1.50**
500 Pages. Arranged for 250 Estimates.
Size 8 x 11 inches. Cloth bound, **\$2.50**

POCKET EDITION.

200 Pages. Arranged for 50 Estimates.
Size 3 1/2 x 8 in. (oblong). Flexible cloth
binding, **\$0.50**

CONTRACT AND ESTIMATE RECORD BOOK FOR STEAM AND HOT WATER HEATING

200 Pages. Arranged for 100 Estimates.
7 x 12 inches. Cloth bound, **\$1.50**

NOTE. The omission of one item in an estimate on a plumbing or heating job might result in the loss of all profit. These books provide a reliable, accurate, business-like record, and a sure means of avoiding loss due to mistakes and omissions.

Sent prepaid on receipt of price.

W. J. ADAM, - - Joliet, Ills.

Plumbing and House Drainage Problems.

244 Pages; 146 Illustrations; Size, 6 x 9½ inches. Cloth bound. Price, \$1.50.

This volume is devoted to practical plumbing and house drainage, treating many of the most difficult problems arising in the practice. Much of the subject-matter is presented in the form of questions and answers. The answers, as a rule, consist of descriptions of methods of properly installing work, accompanied by appropriate illustrations, which make the text clear. Incorrect ways of doing work are also pointed out, accompanied by examples of successfully installed plumbing and drainage. Hot water circulation and hot water supply in buildings are treated at considerable length.

PART OF CONTENTS:

DANGEROUS BLUNDERS IN PLUMBING.

HOT WATER CIRCULATION IN BUILDINGS.

HOT WATER SUPPLY IN VARIOUS BUILDINGS.

Steam Heating Problems.

233 Pages; 109 Illustrations; Size, 6 x 9 inches. Cloth bound. Price, \$1.50.

This book contains a compilation of questions, answers and descriptions relating to Steam Heating and Steam Fitting, expertly treated and adapted to the wants of those who design, construct and have charge of steam-heating apparatus. The work embodies results of some of the best experience and practice in the trade, presenting solutions of many difficult problems connected with the steam-fitter's work. We reproduce some of the subject-matter headings of Steam Heating Problems, which are of interest as indicating the practical character of the problems and questions which are treated.

BOILERS.

On blowing off and filling boilers.
Where a test-gauge should be applied to a boiler.
Domes on boilers; whether they are necessary or not.
Expansion of water in boilers.
Cast vs. wrought iron for nozzles and magazines of house-heating boilers.
Pipe-connections to boilers.
Passing boiler-pipes through walls; how to prevent breakage by settlement.
Heating-boilers. (A problem.)
Isolating-valve for steam-main of boilers.
On the effect of oil in boilers.
Proportions for rivets for boiler-plates.
Iron rivets and steel boiler-plates.
Is there any danger in using water continuously in boilers?
A supposed case of charring wood by steam-pipes.
Domestic boilers warmed by steam.

VALUE OF HEATING-SURFACES.

Computing the amount of radiator-surface for warming buildings by hot water.
Calculating the radiating-surface for heating buildings—the saving of double-glazed windows.
Amount of heating-surface required in hot-water apparatus boilers and in steam-apparatus boilers.
Calculating the amount of radiating-surface for a given room.
How much heating-surface will a steam-pipe of given size supply?
Coils vs. radiators and size of boiler to heat a given building.

Calculating the amount of heating-surface.
Computing the cost of steam for warming.

RADIATORS AND HEATERS.

Improper position of radiator-valves.
Hot-water radiator for private houses.
Remedying air-binding of box-coils.
How to use a stove as a hot-water heater.
"Plane" vs. "Plain" as a term as applied to outside surface of radiators.
Relative value of pipe on cast-iron heating surface.
Relative value of pipe on steam-coils.
Warming churches (plan of placing a coil in each pew).
Warming churches.

PIPE AND FITTING.

Steam-heating work—good and indifferent.
Piping adjacent buildings: pumps vs. steam-traps.
True diameters and weights of standard pipes.
Expansion of pipes of various metals.
Expansion of steam-pipes.
Advantages claimed for overhead piping.
Position of valves on steam-riser connection.
Cause of noise in steam-pipes.
One-pipe system of steam-heating.
Air-binding in return steam-pipes.

How to heat several adjacent buildings with a single apparatus.
Air-binding in return steam-pipes, and methods to overcome it.

VENTILATION.

Size of registers to heat certain rooms.
Determining the size of hot-air flues.
Window ventilation.
Removing vapor from dye-house.
Calculating sizes of flues and registers.
On methods of removing air from between ceiling and roof of a church.

STEAM.

Economy of using exhaust steam for heating.
Heat of steam for different conditions.
Superheating steam by the use of coils.
Effect of using a small pipe for exhaust steam-heating.
Explosion of a steam-table.

CUTTING NIPPLES AND BENDING PIPES.

RAISING WATER AUTOMATICALLY.

MOISTURE ON WALLS, ETC.

MISCELLANEOUS.

Heating water in large tanks.
Heating water for large institutions and high city buildings.

Questions relating to water-tanks.
On heating several buildings from one source.
Coal-tar coating for water-pipe.
Filters for feeding house boilers.
Other means of clarifying water.
Testing gas-pipes for leaks, and making pipe-joints.
Differential rams for testing fittings and valves.
Percentage of ashes in coal.
Automatic pump-governor.
Cast-iron safe for steam-radiators.
Preventing fall of spray from steam-exhaust pipes.
Heating and ventilation of a prison.
Amount of heat due to condensation of water.
Expansion-joints.
Resetting of house-heating boilers—a possible saving of fuel.
How to find the water-line of boilers and position of try-cocks.

MISCELLANEOUS QUESTIONS.

Applying traps to gravity steam-apparatus.
Connecting steam and return risers at their tops.
Power used in running hydraulic elevators.
On melting snow in the streets by steam.
Arrangement of steam-coils for heating oil-stills.
Converting a steam-apparatus into a hot-water apparatus and back again.
Condensation per foot of steam-main when laid under ground.

These books will be sent postpaid on receipt of price, \$1.50 per copy.

DAVID WILLIAMS COMPANY, Publishers, 232-238 William Street, New York.

The Kelsey Warm Air Generator.

A HEATING APPARATUS with from nine to seventeen vertical corrugated cast iron flues, or Sections, forming the Fire Cylinder and Combustion Chamber, and having 65 square feet of heating surface to each square foot of grate surface.

Warms thoroughly and to the proper temperature great volumes of air, by passing it through the flues, and conveys it to every part of the building.

Provides heat and most perfect ventilation for Residences, Churches and School Buildings.

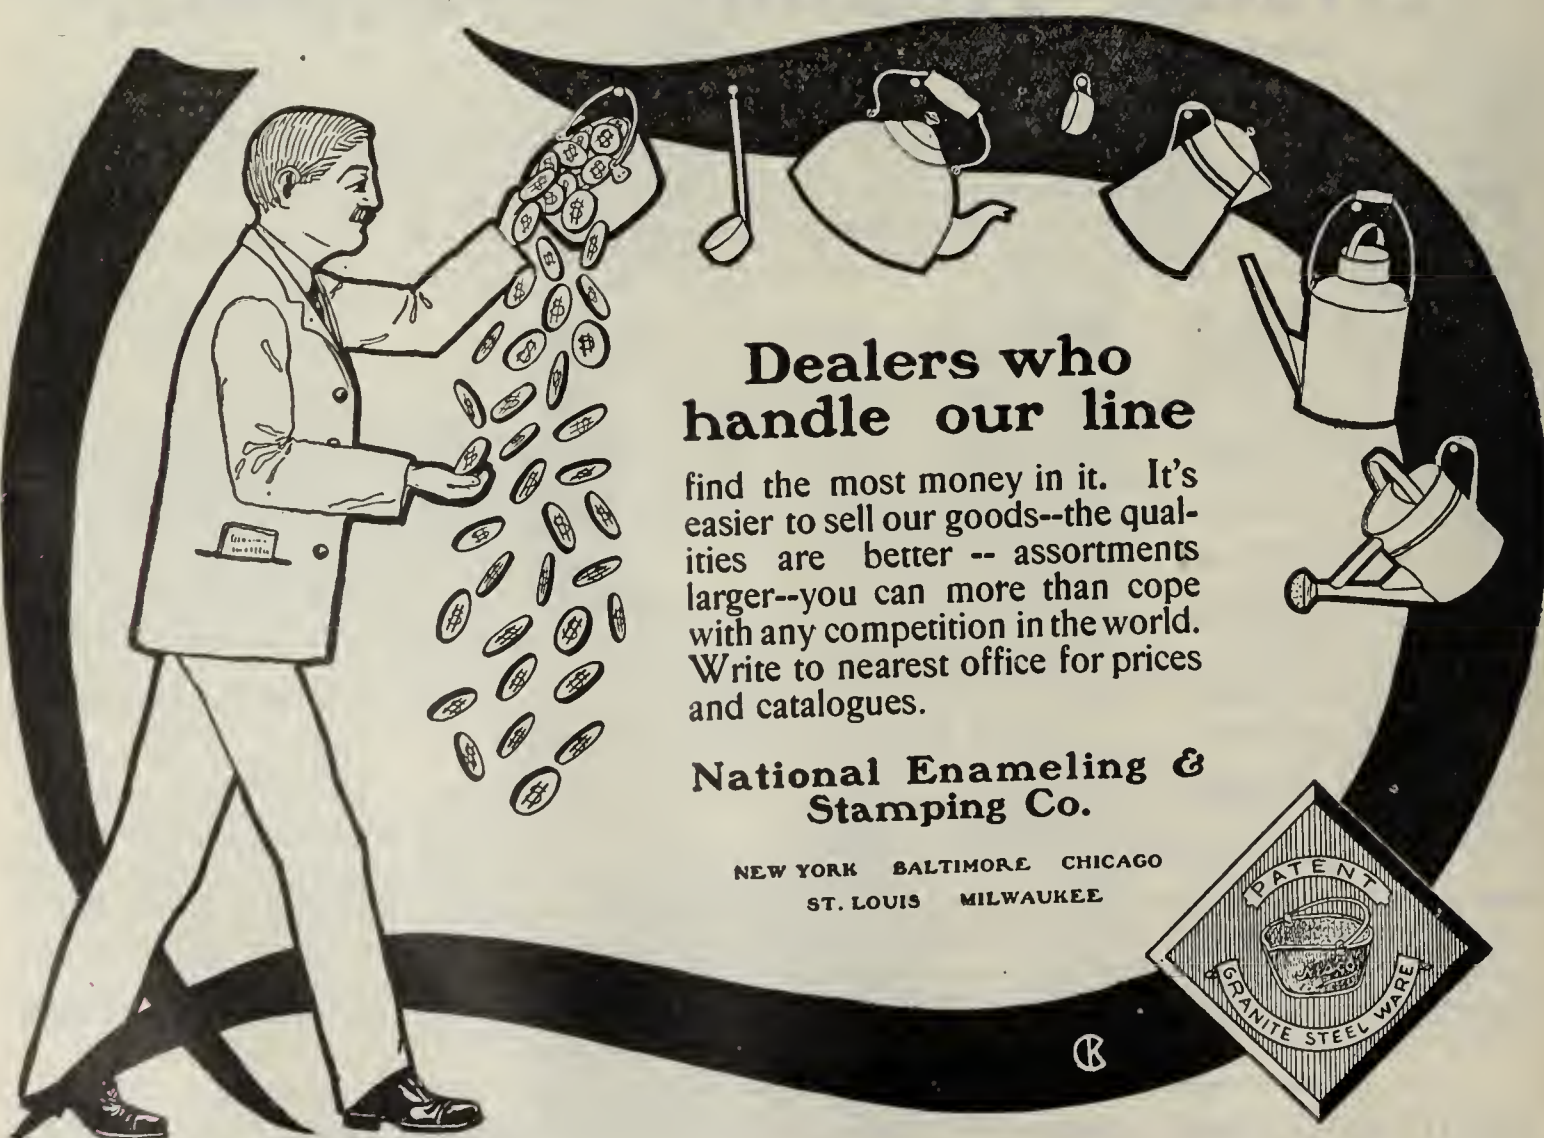

Accomplishes results which lead to further sales at satisfactory profits for the dealer.

Send for 164 Page Book of "Opinions." 20,000 in use.

A Strong Iron Market.

In spite of the blowing out and banking of a number of blast furnaces in the East, in Virginia and in the Ohio Valley, caused by the shortage of fuel supplies, the active pig iron producing capacity of the country on July 1, according to the statistics of *The Iron Age*, was larger than it has ever been before. It is explained that this is due to the fact that a number of large plants, notably in the Central West, have resumed after the short strike of the furnacemen in the Valleys. There were in blast on the first of this month pig iron furnaces whose aggregate capacity amounted to 352,590 tons per week, as against 344,748 tons on June 1, and 352,064 tons on May 1, the previous highest record. Considering all the circumstances of strikes and fuel shortage, the record of June, with an output of 1,478,456 tons of pig iron, was a good one. If everything goes well the July production should go considerably above the 1,500,000-ton mark. At the same time the anthracite coal strike is still troubling some of the Pennsylvania furnaces, and complaints are becoming more frequent and more urgent that the coke makers who are running are not able to keep their customers regularly supplied. Notwithstanding the very large current production of pig iron the output is still considerably below the capacity of the country. Furnace stocks are at an almost insignificant point and importations of foreign iron for consumption in the East are going on steadily.

Nearly all the trouble in the pig iron market thus far has fallen upon the makers of foundry iron and the founders are meeting with serious difficulties. While there is some scarcity of pig iron for steel manufacture it does not involve any serious shortage, and the great mills have experienced little inconvenience so far from that source, particularly as the summer slackness is causing a shutdown of a number of the mills that are large users of steel. Foundry iron for prompt and early future delivery is practically unobtainable, and such small lots as are offered are quickly snapped up by consumers at fancy prices. Taken all in all, the first six months of 1902 broke all records in the iron trade, both in tonnage and profits, and manufacturers would probably ask nothing better than a continuance of the same conditions in the latter half of the year. From the present outlook it would seem that their wishes in this regard are likely to be fulfilled, for, unless all signs fail, the last six months of 1902 are likely to be just as good in regard to both the volume of business and the mar-

gin of profit as the first half of the year. Meanwhile, the high price and scarcity of foundry iron are likely to exert an advancing influence upon the price of all goods into the manufacture of which iron enters, and this will be an important factor in the markets for many of the products in which the readers of *The Metal Worker* are especially interested. There is no reason to suppose that there will be any decline in the price of iron this year, and probably not in the first half of 1903.

The Acetylene Convention.

The manufacture of apparatus for illuminating and other purposes using acetylene gas has assumed considerable importance of late, and the past year's meetings of the manufacturers engaged in this line of business have brought together a considerable number of men representing large capital, resulting in the formation of an Association of Acetylene Goods Manufacturers. Preparations are now being made for holding, in Chicago on August 10 to 16, the annual convention of this association. Heretofore it has been customary, after the transaction of the regular business, to discuss papers prepared by different members, covering not only the scientific construction and operation of the apparatus, but also methods for extending the sale of apparatus for generating acetylene gas for illuminating buildings from the small suburban cottage to the largest hotel. At this year's meeting increased interest will doubtless attend the discussion of the lighting by this medium of small towns and villages. Reports indicate that not only has the carbide from which the acetylene is generated been produced in larger quantities, but also that the demand has shown a magnificent increase. This is largely due to the satisfactory operation of acetylene apparatus, whether small lamps for reading tables or generators and systems for residences and hotels, as well as the more extensive plants for lighting whole villages. The simplicity of operation, the ease of management and the satisfactory character of the illuminant have been so fully demonstrated that the period of introduction seems to be practically past and the natural demand, due to the excellence of acetylene gas, is repaying all who have expended effort and shown enterprise in this branch of industry.

Plumbers' Day

The plumbing trade is to be congratulated on the unanimity of feeling throughout the country that an outing at least once a year is a desirable custom as affording to the plumbers an opportunity for meeting in a social way under the pleasantest conditions. The master plumbers' associations in various centers of the East have found Saturday to be a good day for an outing, and it is not uncommon at this season to see in the show windows of plumbing shops cards announcing that a certain Saturday, or some other date, will be observed as "Plumbers' Day," when the shop will be closed. On these occasions the master plumbers, and in many instances some of their journeymen, find their way to some convenient spot for a day's enjoyment. While a good dinner is by no means the least important feature of the event and no small enjoyment is derived

from the various games and contests, the greatest benefit comes from the social meetings. The outing often provides an opportunity for the explanation of annoyances or the removal of some of the ill feeling that occasionally follows competition for some important piece of work. These outings are also well attended by salesmen from the supply houses, and through the acquaintance thus made when free from all the constraints of business a better understanding is established in the trade that prevents much of the friction that is apt to arise in the course of business transactions. In many places the people have grown familiar with the custom and building contractors and private individuals alike adjust their requirements so as not to interfere with this excellent and growing custom of the trade. In some sections Plumbers' Day is now an old institution, and is looked forward to with pleasure as an occasion for the renewal of old friendships and the making of new acquaintanceships. Moreover, it is often used as an opportunity for State officers to do good work for their associations, and invitations to members of nearby associations have led to an interchange of such courtesies which has been more far reaching in its beneficial effect than was ever anticipated. In view of the renewed vigor with which business is resumed after a well spent outing no loss has been found to attend the well earned holiday. The whole plumbing trade would do well to arrange to enjoy one such day of relaxation from business every year.

End of the Illinois Anti-Trust Law.

The last vestige of the Illinois anti-trust law was recently declared unconstitutional by a local court. Suits involving a total of \$10,000,000 had been instituted by the Attorney-General of the State to collect fines for violation of the law requiring affidavits from corporations that they are not a party to any pool, trust or combination. A section of the anti-trust statute of 1891 prescribed that such affidavits should be filed annually by corporations with the Secretary of State under penalty of a fine of \$50 for each day of delay after a certain date. For years this law was practically a dead letter. Corporations were regularly notified by the Secretary of State that such an affidavit was expected, but if it was not forthcoming no proceedings were taken to punish the delinquents. About 1897 and 1898 the formation of a number of consolidations caused an awakening of the dormant apathy to trusts, and the State officials decided to make an attempt to enforce the law. In 1899 attorneys for the State began no less than 1200 suits in the city of Chicago alone to recover fines from corporations refusing or neglecting to make the prescribed affidavit. The Illinois Manufacturers' Association undertook the defense of their members who had been sued, but it was not until the past month that any of the cases came to trial. Meanwhile the United States Supreme Court had decided in other cases brought to test the Illinois anti-trust law that it was unconstitutional, because it discriminated between parties subject to its provisions. This ruling has just been held by the Illinois court to apply with equal force to the section of the law imposing fines on corporations for their failure to file affidavits as above set forth.

The principle seems to be clearly established by these decisions that legislation against pools, combinations or trusts must be general in its character to stand the test of constitutionality. The courts will not sustain attacks on corporations simply because they are corporations. The corporate form of conducting business operations, whether large or small, is not only strictly legal but has

existed so long and is so thoroughly interwoven into our business fabric that the popular prejudice against it is unreasonable. It is the existence of this prejudice which is responsible for much of the anti-trust legislation which has been annulled by the courts. Individuals, partnerships and labor organizations are almost invariably exempted from the pains and penalties of anti-trust laws. They can enter into pools, combinations and agreements which may have a most serious effect in bringing about restraint of trade, and anti-trust laws have no terror for them. This, however, will not be countenanced by the courts, and hereafter corporations must be considered by law-making bodies as entitled to equal rights with individuals, partnerships and labor organizations.

A Half Year's Fire Loss.

The fire loss of the United States and Canada in the first half of the present year continues the heavy record which has characterized it during the last two or three years, amounting to no less than \$87,105,850, or an average of over \$14,000,000 per month. The losses for the corresponding period of 1901 amounted to \$88,926,150, and in the first six months of 1900 to \$103,298,900. While the figures for 1902, so far, are slightly better than those for the corresponding period of last year, when the total was materially swollen by the great conflagration at Jacksonville, as the record for the preceding year was enlarged by the Hoboken disaster and several unusually great fires which occurred in that period, the present year's losses are deplorably great. The continuance of such heavy losses, in spite of all the efforts of the fire departments, with their modern equipment, is a fact to be lamented. That between \$150,000,000 and \$200,000,000 worth of property is wiped out annually by fires, many of which must have been preventable, should secure some action by the city authorities and the fire insurance companies, with a view to the stricter enforcement of building laws and the encouragement of a more extended use of fire proof materials in the construction of new buildings. The past few years have been disastrous ones for the fire insurance interests, and it would seem to be time for those companies to exercise a stricter supervision, not only in their own interests, but also in the interests of the different communities in which they do business. A number of the weaker fire insurance concerns have gone under in the past two or three years by reason of their heavy losses; but those that are left are surely strong enough to carry out any salutary measures that may be decided upon in the interests of more effective fire protection in American cities and towns.

Commerce between the United States and its newly acquired territories is growing with remarkable rapidity. In 1897, the year preceding that in which Porto Rico, Hawaii and the Philippines came under the American flag, the total shipments to those islands, according to the figures of the Treasury Bureau of Statistics, amounted to \$6,773,560. In the fiscal year ending June 30, 1901, they were over \$30,000,000, and in the fiscal year just ended they will be, according to such figures as the Bureau of Statistics can obtain, fully \$35,000,000. To this may be added the estimate of \$15,000,000 on shipments to Alaska last year. This would bring the total sales of American goods in the noncontiguous territory of the United States up to about \$50,000,000 for the last fiscal year, against about \$10,000,000 in that same territory in 1897. On the import side the same territory of the United States is now supplying about \$50,000,000 worth per annum of their products for use in the United States.

MEETING OF SOUTHERN STOVE MANUFACTURERS' ASSOCIATION.

ADVANCE IN PRICES.

An important meeting of the Southern Stove Manufacturers' Association was held at the Read House, Chattanooga, Tenn., on July 2, when several matters of trade interest were considered. The gathering was one of the largest ever held by the association, the meeting being attended by practically all the leading stove manufacturers of the Southern district. Among those present were the following:

Otto Agricola, Agricola & Jones Mfg. Company, Gadsden, Ala.
Joseph Bower, Avondale Stove Company, Birmingham, Ala.
J. P. Bowle, Rome Stove Works, Rome, Ga.
J. E. Fair, Fair Foundry Company, Knoxville, Tenn.
H. D. Gibson, Chattanooga Stove Company, Chattanooga, Tenn.
F. D. Griffith, Southern Foundry & Machine Company, Knoxville, Tenn.
J. D. Hanks, Hanks Foundry, Rome, Ga.
H. H. Hedden, Mountain City Stove Company, Chattanooga, Tenn.
C. C. Hunnington, H. Wetter Mfg. Company, Memphis, Tenn.
B. H. Jones, Atlanta Stove Works, Atlanta, Ga.
Sam D. Jones, Atlanta Stove Works, Atlanta, Ga.
John McClean, Avondale Stove Company, Tennessee.
J. H. McClure, Phillips & Buttorf Company, Nashville, Tenn.
D. C. McLaine, Union Stove Works, Dalton, Ga.
A. Randle, Southern Co-operative Company, Rome, Ga.
A. D. Reynolds, Enterprise Stove Company, Bristol, Tenn.
D. R. Saunders, Standard Stove Works, Fort Payne, Ala.

The Lizzie Lowman Stove Works and the Sheffield Stove & Foundry Company, both of Sheffield, Ala., were

still further advance in prices should not be regarded as a surprise.

HINTS TO FURNACEMEN—THE NEW CREED.

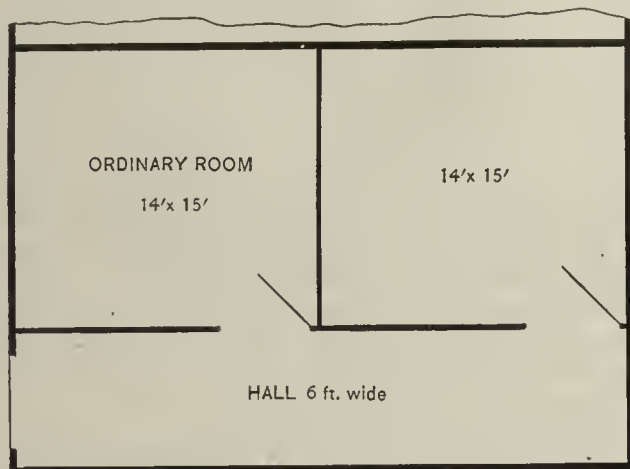

BY W. R. M.

"Ventilation Practically Considered" is the title of a solid mass of information in *The Metal Worker* of December 12, 1896. It emanated originally from Roger I. Wade, Chief Inspector of the State of Massachusetts, and I quote from it these texts with the recommendation that the readers of *The Metal Worker* overhaul their files and peruse the entire article.

"Experience and careful observation have made clear that it must be determined by the number of persons to whom air is to be supplied."

"Whether the room is large or small, the ceiling high or low, the quantity of air in the room is of little moment when compared to the whole quantity required when the room is occupied. The best authorities tell us that not less than 30 cubic feet of air per minute is required for each person to maintain even a reasonable degree of purity."

It seems to the writer that this doctrine is particularly applicable to rooms containing only one person, as, for instance, in isolation hospitals or pest houses. In these days it is not uncommon for persons having small pox to travel a number of miles to a pest house or isolation hospital, and the sufficient reason for this is be-

THE METAL WORKER

THE METAL WORKER

Fig. 1.—Section of Floor Plan Divided into Two Rooms. Fig. 2.—Same Floor Area Divided into Eight Rooms of Uniform Size.

HINTS TO FURNACEMEN.—THE NEW CREED.

not represented at the meeting, but telegrams were received from them to the effect that they would be controlled by whatever action was taken by the convention. With these there remains only one active foundry in the Southern district which is not a member of the association.

The question of prices was considered, and it was decided to make an advance of 10 per cent. in the price of stoves, to apply to all territory south of the Ohio and Potomac rivers. We understand that this course was adopted by reason of the recent rapid advance in the cost of coke and iron and also in the price of labor. There was no opposition to the advance in stove prices, as all present seemed to think the increased cost of manufacturing fully justified the action of the meeting. The entire morning session was spent in discussing the cost of labor and material.

In the afternoon the same subjects were considered and officers for the ensuing year were elected as follows:

President, J. P. Bowie of Rome, Ga.

Vice-President, C. C. Hunnington of Memphis, Tenn.

Secretary, A. Randle of Rome, Ga.

The meeting adjourned at 6 o'clock in the evening subject to the call of the chairman. It was intimated after the adjournment that, in view of the tendency of prices in the iron market and the condition of labor, a

cause of the cost of construction of hospitals and because the village or borough is unable to provide the proper building. In view of this state of affairs the writer suggests a compartment system of isolation as the most economical obtainable. As indicated in the foregoing text, the dimensions of the room are of little or no moment, and if we economize in floor space we consequently economize in ground space, building materials and in the capacity of the heating and ventilating apparatus as well as in the greater number of patients cared for on a given amount of floor space.

Referring to the sketches which I inclose, Fig. 1 represents a section of a floor plan, 20 x 28 feet, divided into two rooms each 14 x 15 feet in area and with a hall 6 feet in width. In Fig. 2 is shown a portion of a floor plan of the same dimensions divided into eight compartments 7 x 7 feet in area and arranged both sides of a hall 6 feet in width. With these provisions and thus isolated, patients suffering from various contagious diseases and in different stages of the same disease would be much more comfortable. The walls of the room should be faced with tile, or other nonabsorbent material, which would be easily kept clean. The heating and ventilation would be an easy problem, but it must be efficient or the scheme is spoiled. The Thunder Mug No. 9 would supply the air, and an aspirating flue or a fan would secure the exhausts.

Air Supply Required in Cold Air Duct.

10,000 cubic feet of space to be heated	requires	250 square inches.
12,000	"	300
14,000	"	348
16,000	"	432
18,000	"	450
20,000	"	498
24,000	"	600
28,000	"	699
32,000	"	798
40,000	"	1,000
50,000	"	1,248

Now that we have the proportions for the furnaces, grates and cold air ducts for the several sizes of buildings, the next thing is to proportion the warm air pipes for the different rooms. To do this you will apply the following rules:

HEAT PIPE AREA FOR DWELLING HOUSES.

For rooms on the first floor having a moderate exposure divide the volume of the room in cubic feet by 30, or by 25 to 20 for rooms having great exposure. For second-floor rooms the divisor may range from 35 to 25, and for third-floor rooms from 40 to 30.

A more accurate method is to proportion the area of the pipes to the cooling surfaces in the rooms. This may be done by the following rule: For rooms on the first floor add together the total glass surface and one-fourth of the area of the exposed walls in square feet, and multiply the total by 1.5. The product is the proper area of the pipe in square inches. For second-story rooms multiply by 1 to 1.25, according to the exposure; and for the third story by 0.75 to 1.

Another method is to divide the entire cubical contents of the building by 30. This gives you, in whole numbers, the amount of warm air pipe area required to heat the building. Then, of course, you have to proportion the warm air pipes according to the sizes of the different rooms. Be careful to make the combined area of the pipes equal to the amount obtained by dividing by 30.

FOR SCHOOLS, HALLS, CHURCHES, Etc.

Having found the quantity of air required per minute the size of the pipes may be computed by dividing the required volume by the velocity of the air current. In all ordinary cases this may be safely assumed at 4 feet per second at the first floor, 5 feet at the second floor and 6 feet per second at the third floor. Another method, equally good, is to assume that 1 square inch of stack, or flue, area will supply 100 cubic feet of air per hour at the first floor, 125 at the second and 150 at the third floor. It is assumed in the foregoing rules that the average temperature of the warm air in the flues is about 140 degrees, and that the air is moved solely by natural draft.

Reliable Ranges and Heaters.

Conforming in its general composition and mechanical make up to the excellent style of trade publication usually issued by the Schneider & Trenkamp Company of Cleveland, Ohio, and Chicago, Ill., is a catalogue of 68 pages, illustrating and describing the Reliable steel ranges and combination coal and gas ranges, which this enterprising concern manufacture in great variety. The opening pages call attention to the special features of the Reliable goods, prominent among which are the corrugated sectional fire box linings, removable front, end lining plate, new grate frame and removable grate door. All ranges are furnished with bodies made of Wood's polished steel or Japan finished, while the top is in one piece, which the manufacturers claim will not crack from the heat. All flues and plates are lined with sheet asbestos, with 2-inch air space and two thicknesses of asbestos underneath the bottom oven plate. The claim is made that this construction thoroughly protects the floor from oven heat and the cold air from striking the oven plates. The Reliable ranges are fitted with balance drop oven door, cast iron flue at the back, duplex grate and other features which cannot fail to command the careful attention of the wide-awake dealer. Directions for ordering ranges are presented, together with a great deal of interesting information for the dealer. Various pages are devoted to steel range repairs, and in conclusion attention is given to the Reliable combination gas and coal ranges.

The company have also sent out a 64-page pamphlet, of a size convenient to carry in the pocket, relating to Reliable gas heaters, including sheet iron cylinder stoves, open front constructions, parlor gas grates, gas radiators, burners, &c. A third publication relates to the Reliable oil heaters, which are offered in several styles and sizes, some of the goods being provided with a handle or bail so that a heater may be moved from room to room or from one location to another in the same apartment. The company refer especially to their No. 553 as the latest addition to their oil heater line, and to the fact that all parts are stamped from extra heavy steel. Still another pamphlet illustrates and describes the Reliable circulating water heater, the engravings showing it in sectional view and also connected to an up-right boiler.

The Crown Low Down Warm Air Furnace.

A recent addition which the March-Brownback Stove Company of Pottstown, Pa., have made to their already extensive assortment of heating specialties is the Crown furnace of the low down type, a skeleton view of which is presented herewith. It is made in several sizes of such capacity as to adapt it for heating dwellings ranging from five to six rooms and containing 10,000 to 25,000 cubic feet, up to those containing from 11 to 14 rooms and from 45,000 to 65,000 cubic feet of area. The furnace is made with double casings, having asbestos

The Crown Low Down Warm Air Furnace.—Skeleton View.

felt between so as to prevent radiation into the cellar. The skeleton view shown herewith shows the drum attachment with the inside warm air flue and buffer plate between the inner and outer walls for directing the heat to all parts of the drum for radiation. The manufacturers state that the combined inner and outer surface of this drum for radiation is unusually great, thus making the furnace unusually powerful in operation, while the general construction is such that no expert is required to clean it. In connection with the cold air supply to the Crown furnace a frame is employed especially adapted for use in wet cellars or where it is objectionable to use a cold air trench under the heater. Galvanized pipe is used to run from the cellar window inlet over the cellar floor to the rear or sides of the heater at the bottom to connect with this collar, which is simply riveted to the galvanized casings and the galvanized iron is cut out. The company state that this is fast becoming a very popular method of supplying cold air to the furnace, and that it has the advantage of being easily made and much less expensive than a brick trench, while at the same time it is more easily cleaned and less affected by dampness.

WESTERN STOVE PRICES ADVANCED.

The Western Association of Stove Manufacturers met in Chicago on July 8, the result of the conference being an advance of 5 per cent. in the prices of all stoves. The reason assigned for the advance is the sharp advance in the prices of pig iron and other raw material. There was a strong disposition to advance prices 10 per cent., but it was thought best to pursue a conservative course, especially as the crop outlook is as yet uncertain. In view of the further advance in pig iron during the past few days, however, it would not be surprising if another 5 per cent. advance were made within the near future.

THE STOVE FOUNDERS' DEFENSE ASSOCIATION.

An agreement has been entered into between the Stove Founders' National Defense Association and the Metal Polishers', Buffers', Platers' and Brass Molders' International Union. The agreement provides that all disputes shall be referred to the arbitration of the presidents of the respective associations. Should they fail to agree, the dispute will be carried to a conference board of six members, three employers and three employees. The agreement is similar to that which now exists between the Founders' Association and the Iron Molders' Union, which has prevented strikes in that industry for 15 years.

The Iron Molders' Union of North America, now in session at Toronto, Canada, has requested the Stove Founders' National Defense Association to appoint a committee to meet a similar committee of the Iron Molders' Union in conference regarding an increase in the ratio of apprentices. The committee appointed by the Defense Association is as follows: C. H. Castle, Quincy, Ill.; Thomas J. Hogan, Chicago; Henry Cribben, Chicago; J. Dwyer, Detroit; E. W. Peck, Rochester, N. Y., and D. Macafee, Quincy. July 15 is the date fixed for the conference. Thomas J. Hogan, secretary of the National Defense Association, will visit Philadelphia and New York upon business connected with the association en route to Toronto.

ODD PLATES.

THE PECK-HAMMOND COMPANY of 309 West Fourth street, Cincinnati, Ohio, call attention to the great economy in the consumption of fuel resulting from the use of their Winner Down Draft Oak Stove, which was recently illustrated in these columns. They state that customers who have demonstrated its merits report that it does not consume more than one-half the amount of fuel necessary for an ordinary Stove, and that in some cases the figures show a consumption of fuel as low as one-third of the usual amount.

THE S. OBERMAYER COMPANY, manufacturers of Foundry Equipment and Supplies, have recently outfitted the following foundries completely: Peck-Williamson Heating & Ventilating Company, Wellston, Ohio; Superior Gas Engine Company, Springfield, Ohio, and the Laidlaw-Dunn-Gordon Company, Cincinnati, Ohio. In the equipment was included the Cupolas, Ladles, Tumblers, Foundry Facings and Supplies of all kinds. The new technical foundry for instruction at the Armour Institute, Chicago, also was recently equipped by the S. Obermayer Company.

CAREY A. MOORE, who represents Rathbone, Sard & Co. of Albany, N. Y., in the South, with his headquarters in Baltimore, has been enjoying a vacation in Canada, acquiring new energy for pushing the Acorn line of Stoves and Ranges this fall.

THE READING STOVE WORKS, Reading, Pa., operated by Orr, Painter & Co., will make some improvements, \$100,000 of preferred stock having been subscribed. The works have had a very busy season.

THE STEIGER & KERR STOVE & FOUNDRY COMPANY, San Francisco, Cal., have purchased a lot at Eighteenth and Folsom streets, upon which they are erecting a mounting and storage building, 50 x 150 feet; two foundry buildings, 50 x 130 feet each; carpenter shop, pat-

tern rooms, &c. The new plant will be equipped with the machinery from the old one, and, with the exception of motors and elevators and a No. 7 or 8 Sturtevant fan, no new equipment will be required.

A NEW Stove foundry is to be established at Quincy, Ill., under the name of the Star Stove Works, by a company shortly to be incorporated with a capital stock of \$50,000.

THE MAGEE FURNACE COMPANY, 32-38 Union street, Boston, Mass., with Western agency at 86 Lake street, Chicago, have embodied many interesting features in the Magee Standard Oak Stove, which they offer for burning coal, coke or wood as a fuel. A few of these features include deflector ring, air tight ash pit, double feed door fitted with check draft and mica illumination and large ash pit door. The point is made that the Stove is so mounted and fitted that the parts will not warp or buckle.

THE DANGLER OIL HEATER FOR 1902, which is being offered by the Dangler Stove & Mfg. Company, Cleveland, Ohio, is made of polished steel with either brass or tin tank. It is ornamental in its design and powerful in operation. Its weight is only 10 pounds and it stands 27 inches high.

THE RINGEN STOVE COMPANY of St. Louis, Mo., are making the outside sections of the top plates of their Quick Meal Ranges of steel, while the oven doors, corner tubes, back flue and base are of steel plate stamped out and formed up in shapes which make the body light, strong and what is claimed to be practically indestructible. Reference is made to the fact that Quick Meal Polished Steel Ranges are increasing in popularity and gaining friends every day.

ONE of the many new patterns of Base Burners brought out this season by Rathbone, Sard & Co. of Albany, N. Y., and Aurora, Ill., is the Brilliant Acorn for hard coal. In its decorative treatment what is known as "Acorn silver nickel" has been liberally employed, which, with ample mica illumination, gives a most brilliant effect when the Stove is in operation. It is made in four sizes and embodies what the manufacturers describe as a new principle in the way of hot air circulation. The manufacturers refer to the Brilliant Acorn as the most attractive pattern which has been offered for many seasons. The Pacific Coast distributors of Acorn goods are the Harry Unna Company of San Francisco, Cal.

THE superiority of Thatcher Furnaces over open fire places is made clear in a graphic depiction of a debate, where in the course of a heated argument the coat tail of one of the debaters has taken fire. This scene is the leading feature of a unique circular which, on being opened, is found to show a broken view of the Thatcher Tubular Hot Air Furnace made by the Thatcher Furnace Company, 240 Water street, New York. The illustration is surrounded by striking arguments to show why the dealer should sell Thatcher Furnaces.

THERE are said to be three uses to which may be put the combination fire bowl and coking magazine used in the Patric Furnace, made by the Patric Furnace Company of Springfield, Ohio. One of these is the coking of soft coal in the magazine while coke occupies the main fire bowl, resulting, it is claimed, in a great saving of fuel; the second is the ability to carry fire in the magazine when comparatively little heat is required, such as during the spring and fall months; and the third is the use of the fire bowl for burning wood. An illustrated catalogue which the company have recently issued shows by means of broken views just how the Furnace operates.

The credit of having reached the highest altitude on record is given to Dr. Bersen and Dr. Suring of Berlin. They first went up to the height of 30,000 feet, losing consciousness for brief intervals. They continued to ascend to 33,790 feet, when one of them became completely unconscious and could not be aroused. The other aeronaut, after making a great effort in opening the valve to descend, also became insensible, and neither of them recovered till the balloon dropped to 16,000 feet.

Buckeye Pumps.

Mast, Foos & Co., Springfield, Ohio, have recently added to their line the pumps illustrated herewith. The Buckeye regulating pump with vertical three-way is shown in Fig. 1 and the Buckeye siphon pump in Fig. 2. The regulating pump has the regulating cylinder attached to the yoke of the pump. When the tank is full or nearly full the float closes the valve in the tank, which produces a back pressure in the regulating cylinder, causing the plunger to rise in the cylinder, which in turn raises the lever which is attached to the weight. The pull out wire of the wind mill being attached opposite the weighted end of the lever, the wind mill is immediately thrown out of the wind. The three-way

No. 1.

No. 2.

Buckeye Pumps.

cock is made regularly with small brass tube, but can be furnished with stuffing box when so ordered.

The siphon pump is so constructed that it is supported by the base casting on the platform of the well, not requiring, it is explained, that the walls of the well be disturbed to place supporting timbers. The pipes extending from the base of the casting to the cylinder of the pump not only support the cylinder, but form air chambers, which, it is pointed out, are essential to the perfect action of this class of force pumps. The base plate also forms a guide for the pump rod. The working barrel of the pump is made of brass, and the check valve and plunger are submerged in the water contained between the outside shell and the brass cylinder.

S. J. HENRY has succeeded Henry & Clayton in the retail Hardware, Stove, Tinware, Agricultural Implement and Sporting Goods business in Central City, Neb. Mr. Henry has remodeled the store and more than doubled the former stock.

The 1902 Steel Framed Roll Paper Holder and Cutter.

The West Supply Company, Columbus, Ohio, have added to their line of paper holders and cutters the one shown herewith. It is constructed of two oblong $\frac{1}{4}$ -inch round coppered steel frames. The feet clamp the frames at and around each lower corner, while the upper corners of the frames are likewise clamped by a neat

The 1902 Steel Framed Roll Paper Holder and Cutter.

quarter-round casting. Added to these are the iron clamps in the center of the upright parts of the frame. The inner part of these have U-shaped projections to support the wooden rollers. The manufacturers claim that the holder and cutter will bear one hundred fold the weight it will ever be called on to support without producing the least strain. They refer to its great strength and lightness as making it a very desirable cutter for the trade. In addition to the form shown in the cut, the devices are made in pyramids of two cutters, one above the other, also in combination form with a 6-inch and a 9-inch cutter on the bottom and a 12-inch cutter on the top.

Steel Pump Oilers.

The Noera Mfg. Company, Waterbury, Conn., have added to their line the steel pump oiler shown herewith. These oilers are made of steel throughout, copper plated,

Steel Pump Oiler.

and have a seamless steel cup bottom. The pump is in the side of the top, out of the way, while the can can be taken apart and the valves and pump inspected. The threads are of standard size, to permit nozzles to be changed to other lengths, and the hole in the end of the nozzles is made small, with room left to bore it out larger. The oilers are made in 1 and $1\frac{1}{2}$ pint, also in 1 and 2 quart sizes. They are referred to as being particularly adapted to railroad use.

The Manufacture of Enameled Ware in America.

The following is an extract from the Census Bulletin of 1900 relating to the manufacture of enameled ware in the United States:

Prior to 1860 the firm of Lalance & Grosjean operated a large number of tinning pots, one of their principle products being tinned iron spoons. This firm also imported and retinned large quantities of French sheet metal goods—that is, articles which were made from heavy sheet iron and always retinned. They began to manufacture articles of this character about 1862, at their works at Woodhaven, Long Island, N. Y., using a machine devised especially for the purpose. As sheet iron of the necessary strength and ductility could not be procured from the iron manufacturers of the United States, imported black plates were used. These sheets were stamped into the desired shapes, and were dipped in a bath of pure tin. In 1876 the company began to draw the larger part of the black plates they consumed from the United States Iron & Tin Plate Company of Demmler, Pa. They now manufacture their own black plates. This New York firm were the pioneer in the United States in the manufacture of what was then known as deep French ware, now commonly called deep stamped seamless ware.

Carnahan Stamping & Enameling Company.

Carnahan Stamping & Enameling Company, Canton, Ohio, are running their enamel department, which started up April 1, to its full capacity both night and day. Their new Servian ware, which is a distinct line and different from anything in the market, is proving a seller with the trade. The enamel in this ware is said to cling to the metal body with remarkable tenacity. The color is of a copper, or Tuscan red, with a fine gloss. The company, at the present time, have an output of about 15,000 pieces per day, and they are now at work increasing their facilities in order to give them four times their present output. The company, in addition to the can and enameling departments, also produce nearly a full line of galvanized ware.

A Rack for Balls of Twine.

The rack for holding a retail stock of twine shown in the accompanying cut was made by joining short pieces

Rack for Holding Twine.

of $\frac{1}{4}$ -inch wrought iron pipe by tees, forming a straight rod about 30 inches long. Into the open ends of the tees other pieces of $\frac{1}{4}$ -inch pipe were screwed, parallel to each other, one directly above the other. The parallel pieces of pipe were of sufficient length each to hold from

10 to 20 balls of twine, according to their size. The rack was hung by screw eyes, one at each end, against the end of the shelving. It could obviously be hung on a post or against a wall, wherever most convenient. This arrangement of the rack permits it to swing horizontally, putting the stock into a small space and at the same time displaying it in good order. The device is in use in the establishment of Eikel & Stempel, Aguascalientes, Mexico.

Stove and Hardware Dealers.

HUGH RUSSELL has nearly completed a new brick building in Ashland, Ky., in which he will open a Hardware store about August 1. Mr. Russell will deal in General Hardware, Tools, Cutlery, House Furnishing Goods, &c. Catalogues from manufacturers in these lines are requested.

THE annual meeting of the Pacific Coast Hardware and Metal Association will take place at the Hotel Del Monte, Monterey, Cal., on July 16, 17 and 18, at which time the annual reports will be presented, new officers elected and subjects of general interest to the jobbing trade of the Pacific Coast discussed.

BRECKENRIDGE & BRADSHAW have disposed of their business at Battle Ground, Ind., to Sherman Shigley, and have bought the Gould, Oliver & Martin stock in Crawfordsville, where they are now located. Their line comprises Hardware, Stoves and Tinware.

DELRAY HARDWARE COMPANY, Delray, Mich., have incorporated with a capital of \$5000. The company handle at retail Shelf Hardware, Stoves and Tinware, Agricultural Implements and Sporting Goods.

TOOL & WORTHEN, Sterling, Neb., have sold their Hardware and Stove business to T. J. Harris & Co.

NASH HARDWARE COMPANY, Fort Worth, Texas, wholesale and retail Shelf and Heavy Hardware, Stoves, Tinware and Sporting Goods, have increased their capital stock from \$40,000 to \$75,000. The company advise us that during the past year they enjoyed the largest and most satisfactory trade in their history. They are enlarging their office and are getting in shape to push their jobbing interests more than ever the coming fall and winter.

THE Hardware store of Whipple & Robinson, Glens Falls, N. Y., was destroyed by fire a few weeks since. The firm, who are dealers in Shelf and Heavy Hardware, Tinware, Sporting Goods, with plumbing, heating and roofing department, have resumed business in temporary quarters.

GEO. B. EDWARDS has entered into partnership with his father, G. W. Edwards, in the Hardware and Stove business in Mendota, Ill., under the style of Edwards Hardware Company. It is the firm's intention to increase their line and variety and run a strictly first-class Hardware and Stove store. G. W. Edwards has conducted this business since its establishment in 1866. Mr. Edwards' son is a stockholder of the Acorn Brass Works of Chicago, with whom he has been connected for the past three years. Wishing to get away from city and office life, and feeling the need of more active employment, Mr. Edwards has made the change above outlined.

GEO. W. SNAPP & Co. have disposed of their Hardware, Stove and Sporting Goods business in Maryville, Mo., to Hudson & Lect.

THE DRYSDALE-ULEN HARDWARE COMPANY, dealers in Shelf and Heavy Hardware, Stoves, Tinware, Agricultural Implements, &c., Bloomfield, Mo., have been succeeded by Drysdale-Buck Hardware Company.

F. H. PICKETT is successor to C. B. Payne in the Hardware, Stove and Tinware business in Cassadaga, N. Y.

G. E. GARD, in the Hardware, Stove and Farm Implement business in Troy Mills, Iowa, has been succeeded by E. F. Biggs.

STANDER & ESMAY, Louisville, Neb., have succeeded Esmay & Rogers in the Hardware, Stove and Tinware business.

A Tunnel Construction for Underground Steam Pipes.

The tunnel construction herein described, says G. W. Blissell in an article in the *Iowa Engineer*, is to be employed in conveying steam, compressed air, electric light and power from the power station of the Iowa State College to the new engineering hall, and will ultimately be extended to the other large buildings of the college, and will constitute the distributing system for the central heating plant.

The total length of the tunnel is 460 feet, consisting of a single stretch 360 feet in length, with right angle offsets at the power station and the new engineering hall of 60 feet and 40 feet, respectively. The grade of the tunnel is about 6-10 foot to the 100 from each end toward an assigned low point, where a connection is made from the floor of the tunnel to a sewer and also from a 4-inch drain tile under the tunnel floor to the same sewer, thus securing internal and external drainage. The internal drainage connection is properly trapped.

The construction of the tunnel itself is shown very well by Fig. 1, which is a cross section.

The walls and roof of the tunnel are hard burned brick, laid up for a 9-inch wall in cement mortar, plas-

permitting expansion to whatever extent may be necessary.

The steam pipe will be anchored securely at about 70 feet from each end of the 360-foot section. The expansion between the anchorages will be provided for by the use of expansion joints of standard design. The amount of expansion thus to be provided for will amount to about 5 inches in the extreme case. The expansion occurring on the outside of the anchorage and toward the ends of the tunnel will be provided for by the spring in the offset.

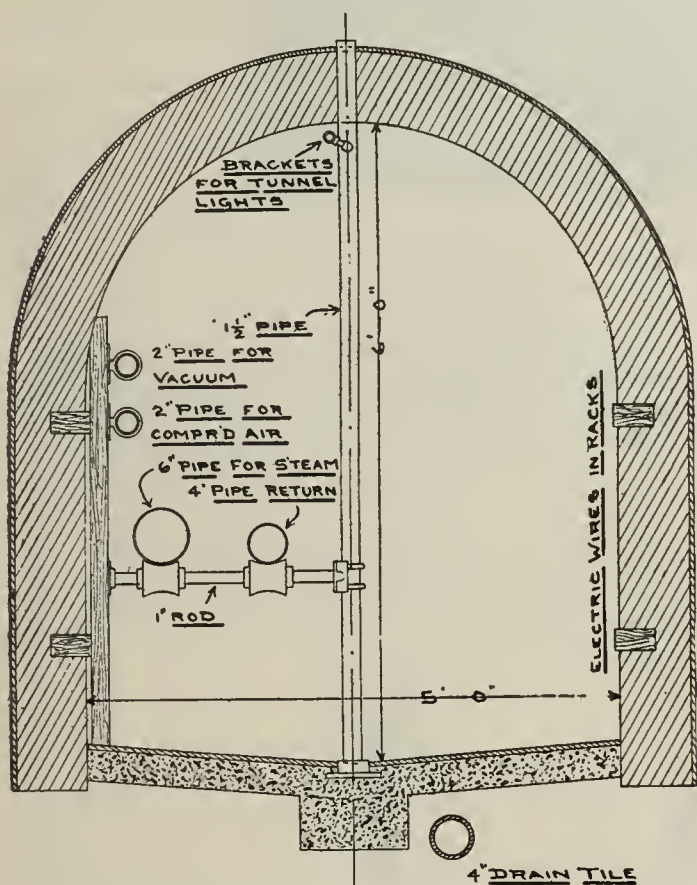

The steam and return pipes will both be thoroughly protected from wasteful radiation of heat by covering them with the best grade of sectional pipe covering. The pressure to be maintained in the steam pipes may be anywhere from atmospheric to 80 pounds to the square inch, but it is not expected that more than 40 pounds to the square inch will be required at any time.

The lighting of the tunnel itself has been provided for by placing overhead a 1/2-inch iron pipe conduit, with receptacles and lamps at intervals of 30 feet. The conduit is supported on brackets on the central column, as shown in Fig. 1.

At the present writing the tunnel itself has been constructed, the ends of the long section at the corners being left open for the insertion of the pipe. These openings will be bricked up later.

The cost of the tunnel, including excavation, brick work, cement work, drain tile, iron columns, wooden brick and back filling, was \$3300, approximately \$7 per foot. The installing of the pipe, including steam, return, compressed air and vacuum pipes and the hangers therefor, and including the lighting of the tunnel itself, is now in progress and will cost \$1800, or about \$3.90 per foot complete. The total cost, therefore, for the whole construction will probably be about \$11 per foot. In comparing the cost of this construction with others frequently used it will be noticed that the same is quite high, but, on the other hand, it is expected that the construction, at least of the tunnel part, will last for all time, and it is reasonable to assume that on account of the accessibility of all of the pipe and electric circuits the same will be kept in better condition than they would if hopelessly buried under the ground, and that on account of these features the running expenses due to the radiation of heat occasioned by the deterioration of the insulation will be reduced to the very lowest figure.

Another advantage is in the use of the tunnel for electric light and power circuits. This exists in the fact that the same will be underground, thereby doing away with unsightly overhead poles and wiring system, and doing away with the liability of such overhead wires becoming entangled or blown or broken down.

A Tunnel Construction for Underground Steam Pipes.

tered outside to a thickness of 1/2 inch with cement mortar. The floor of the tunnel is 4 inches thick, constructed according to the usual specifications for cement sidewalk.

The extreme height of the tunnel on the inside is 6 feet and the width on the inside is 5 feet.

At intervals of 10 feet in the length of the tunnel a 1 1/2-inch steam pipe is placed to serve as a column for carrying supports for the heavy pipes. This column is supported by a flange casting at the bottom, resting on a 12 x 12 pier of concrete, and the column is built into the roof of the tunnel, as shown.

At the same intervals (10 feet), and opposite the columns, are placed two wooden bricks on each side of the tunnel. These will serve on one side to support a 2 x 4 cleat, which will carry one end of the pipe carrier, and will serve for ring pipe hangers, as shown, to carry compressed air and vacuum pipes required for operating the thermostatic heat regulation system of the new engineering hall. On the opposite side of the tunnel will be placed a similar cleat, on which the electric lighting and power wires will be suitably hung.

The pipe carrier consists of 1-inch round iron rod, supported by a flange bolted to the cleat on the wall of the tunnel and by a clamp casting secured to the column in the center. The carriers may be adjusted to any height desired to give the pipes thereon the required grade or fall. The pipes rest upon rollers, as shown, which are free to turn upon the round iron rod, thus

Saunders Pipe Machines.

The last catalogue by D. Saunders' Sons, Yonkers, N. Y., deals very thoroughly with their wide line of pipe threading machines, special machines for pipe mills, tapping and drilling machines, hand stocks and dies for pipe, &c. In their No. 4 C improved pipe threading, cutting and nipple machine, the arrangement of the chuck is such that the pipe is gripped or loosened by the simple movement of the lever, without the necessity of stopping the rotating motion of the gripping chuck, as is the case when the ordinary pipe machine gripping chucks are used—namely, the universal or independent. The movement of the gripping jaws is applied through a system of sliding blocks and levers, which gives the required motion to the chuck jaws to grip any size pipe within the range, 1 to 4 inches, and provides sufficient leverage to grip it firmly by an easy motion of the lever. The operation of adjusting the jaws to grip the different sizes of pipe is very quickly made. After the pipe has been threaded and has to be moved to adjust it for cutting off, or for any other reason, the die head is pushed to one side, allowing the pipe ample room to pass through the cutting head without passing through the die head to the injury of the chasers by the pipe sliding over them.

L. STANTON of Frostburg, Md., who has a branch of his tinsmithing and heating establishment at Lonaconing, has the contract for heating the Presbyterian Church and parsonage in that town with a hot water system, and also for heating the Barton Methodist Episcopal Church with a steam system. These contracts are largely due to the efforts of Samuel Fresh, who is in charge of Mr. Stanton's Lonaconing branch.

PIPING UNDER DIFFICULTIES.

BY PIPER.

Down by the joyous sea waves of historic Coney Island is situated a small but beautifully built hotel, largely patronized in winter as well as summer. The theory that Coney is cut off from civilization during the winter months is wrong, as any one who takes the trouble to journey thither on a fine day in winter can prove for himself. The great Ocean Parkway or Boulevard, one of the finest driveways in America, terminates at Coney Island, and it is not far from this point that the above-mentioned hotel is situated.

The proprietor, owing to a large increase in his business, was compelled to extend his quarters. Some two

Piping Under Difficulties.—Fig. 1.—An Elevation.

years previous to the time here spoken of this same proprietor had a dwelling house built nearby. In the planning and carrying out of the operation great care had been taken to avoid the possibility of striking tide water. Coney Island is but a sand bank, and a not over high one at that, and water is generally found 4 feet below the street level in that part. In this case extra precautions were taken to be on the safe side, as steam heating was to be introduced and was considered one of the chief reasons why a dry basement must be secured. The first floor was placed at 6 feet above the street level, which brought the basement floor about 2 feet above danger line of water.

In starting the hotel project the same architect who planned the dwelling was called on to furnish sketches. These were made, and after many alterations bids were called for and a contractor selected.

Some time after the roof was on it occurred to the owner it was time to talk to us about steam heating. We knew of the undertaking, but had been assured we would be called on in time to go over the building and specify what we wanted in the way of room for boiler and other such details. Certainly, in view of the precautions taken in the case of the dwelling house, we were justified in feeling easy concerning the hotel. Imagine our surprise on visiting the place to find the main floor but 2 feet above the street level. Of course steam heating was out of the question, for the obvious reason that the water line of the boiler must be above the level of our main.

As no place could be had in the main house wherein to set the boiler, a one-story addition was built for the purpose. Meanwhile we planned overhead systems, both steam and water, but were informed that if we could not put in a system that looked, above the cellar, like every other person's apparatus, we could drop the job and the owner would put in stoves and stick the stove pipes through the roof. Here we might say that, owing to architectural difficulties, we could not get a main line to the attic for an overhead hot water system had we tried it. We then laid out the following plan, which was accepted by the owner, so far as the looks of it were concerned.

The deepest we could go with the floor of the boiler room brought the top of our boiler level with the main floor of the house, as shown in Fig. 1. The only thing left to us to do was to install a one-pipe circuit system, as shown in Fig. 2. Personally, we are not enthusiasts on the subject of placing such systems. We had placed, up to that time, quite a number of one-pipe jobs, and while we had had success with them we preferred, and do yet, to hold to the two-pipe for first choice and the overhead system for second.

In running this job out from the boiler the first obstacle was the door leading from the kitchen down to the boiler room. We could not cross this, nor go under it, so we jumped up over it. At the first turn above the door, the highest point, we placed a tee and a nipple and cap, with air valve tapped in on top, to form an air chamber and carried a $\frac{1}{4}$ -inch pipe down where the air valve could be conveniently reached. This collected all the air that would form in two weeks and prevented the liability of stoppage of circulation. The main was carried over and down on the other side of the doorway and taken in under the building, so as to just clear the floor beams. This "siphon" we would advise in any case, as it prevents the possibility of the job turning about and working backward. We have seen such a thing happen, but never where the above provision was made.

The rest of the job was carried out very much as the ordinary one-pipe job is done, the main making a complete circuit beneath the house and returning to the boiler at about the level of the return opening. We would have preferred to run two circuits, one on each side, so as to equalize the temperature of the water throughout the house a little more evenly, but we had girders and other obstructions, which left us no choice in the matter but to run as we did.

As we proceeded away from the boiler we increased the amount of radiation, or rather the ratio, in proportion, slightly, until, at the end of the circuit, we had increased fully 20 per cent. over the ratio used at the

Fig. 2.—Plan Showing Circuit Main.

first connections to the main. This, of course, to provide for loss of temperature in the water toward the end of the circuit. The total amount of radiation was in the neighborhood of 850 feet.

The apparatus was a perfect success, both as to circulation and temperature of building. The smoke pipe, by the way, had also to be dropped down on the opposite side of the boiler from the main and carried under to the flue originally built for it, about 10 feet away.

SWINTON & Co., Port Jervis, N. Y., have secured the contract for heating and plumbing the new Women's Building at the County House, near Middletown, N. Y.

The Improved Tread-Kill Shaking Grate.

The convenience that can be derived from the equipment of the fire boxes of large furnaces of any description with grates so constructed that, by the operation of levers, the fine ashes can be shaken out of the fire and the bars have a grinding effect for crushing clinkers has led W. H. Treadwell & Co., 95 and 97 Liberty

In connection with these grates the company make an extensive line of furnace castings and steam boiler fronts. Their fronts and grates have been used by the heating contractors who have installed the power and heating systems in some of the largest buildings in various sections of the country, and have resulted in efficient and economical service with a saving in labor that has brought additional orders to the manufacturers.

The Improved Tread-Kill Shaking Grate.—Fig. 1.—General View.

street, New York, to produce the Tread-Kill shaking grate, shown in the accompanying illustrations. This grate has been developed as the result of large experience, and has been thoroughly tested before being put upon the market. In Fig. 1 is shown what is termed a "three-bank grate," arranged with twin levers to shake the six units of the grate—three in the front and three in the rear. It is pointed out that the handles, fulcrum and jaws are made of the best quality of malleable iron, while the shaking levers and shaking rods are of forged steel. No part of the grate is made to meet cheap com-

The grates are explained and illustrated in a new catalogue recently issued by the concern.

Central Station Heating.

The Edison Illuminating Company of West Chester, Pa., have let the contract for the installation of a steam heating plant to the American District Steam Heating Company of Lockport, N. Y., and work will begin very shortly on the new plant. The present contract calls for the laying of 3000 feet of iron mains, of different diameters, on brick foundations. Starting at the power house 10-inch pipes will be run through a number of streets. The whole plant is contracted to be completed by September 15, fully six weeks before patrons will need heat, but in order to give the plant a severe test. Superin-

Fig. 2.—View of Separate Parts of Tread-Kill Grate.

petition, but rather with a desire to make it the best on its merit. Every casting, whether gray iron or malleable, is made at the plant of the firm, of their own mixture and under their own supervision.

In Fig. 2 are shown the separated parts of the grate, giving a good idea of the construction of the grate bars, which are strong and very open in pattern so as to allow the free entrance of an abundance of air to the fire to promote combustion. The construction is also designed to prevent warping and to combine strength with durability. The company also make a dumping grate of similar character, which is equally well designed for strength and durability and to aid the boiler under which it is used in getting up steam quickly.

tendent Pyle claims that the company will be fully able to compete with coal prices when that article is at its normal price, and it will be much cheaper than when coal is at present rates. But the great advantages of the street steam heating over the individual private plant is that it can be turned off or on at will, at any time, day or night, and there will also be less fire risk and no dust nor coal dirt about the house.

COLE & ANDRUS, Castile, N. Y., are heating and plumbing the Silver Springs National Bank Building, also the residence of Charles Christ, at the same place. The firm are also installing a Hot Air Furnace in the residence of Chauncey Bramard, at Gainesville.

A Swiveling Joint for a 16-inch High Pressure Steam Main.*

BY R. E. CURTIS, BOSTON, MASS.

All engineers will probably agree that slip or swiveling joints in steam lines are commonly undesirable. Nevertheless, there are frequently cases in which some form of such joint cannot be avoided, and it becomes of importance to reduce their inherent disadvantages to a minimum. The swiveling joint here described was designed to meet a special situation, but its size and construction are such as, perhaps, to make it of some general interest. The problem presented was that of making a full sized connection between the ends of two 16-inch mains, carrying 160 pounds pressure, lying parallel

A Swiveling Joint for a 16-Inch High Pressure Steam Main.

to each other and of such length that the relative movement of the ends by reason of expansion amounted at times to several inches.

The first form of connection to suggest itself, and in all respects the most desirable, had it been practicable, was by a simple loop of pipe. A little calculation, however, showed that this could not be used without danger of excessive stresses being set up. Then several forms of flexible connection were investigated, and the final design adopted as being on the whole most satisfactory in the following particulars: *a*, reasonable form and dimensions; *b*, form and arrangement of parts under stress; *c*, least number of joints requiring packing and removal of those from points where water might collect. All details were designed for a working pressure of 225 pounds.

Each joint consists of two elbows held together by a system of links—a flange bolted to the upper elbow and a length of pipe projecting downward from the flange into a stuffing box formed in the lower elbow. Two of these joints are used, the lower elbows being secured to

the ends of the mains and the upper elbows joined by a length of pipe. The elbows and flanges are of air furnace gun iron, and are of substantial dimensions. The pipe is a piece of 16-inch outside diameter pipe, 15½ inches inside diameter, finished smooth on the outside. The gland and the ring at the bottom of the stuffing box are of composition, the former being held in place by six studs, three of which are long enough to hold it in a position to allow the packing to be easily gotten at. The ring and each end of the gland are made easy fits about the pipe. The endwise pressure is taken up and at the same time the rotation of the joint provided for by six mild steel links carefully fitted and so proportioned that the entire load can be borne by three with ample margin for safety. These links with their supporting bolts form a simple system, which assures a fairly even distribution of stresses, and is always open to observation.

Each complete joint is carried by a sliding support consisting of a chair cast separately (to avoid complication of the pressure part) and bolted to the lower elbow and a bearing plate anchored to the masonry floor. The stuffing box was made of generous depth, and so proportioned that metallic packing could be employed if desired, but so far only asbestos packing has been used, and the joint has ordinarily been perfectly tight.

Conditions unforeseen at the time of making this installation have led to a radical rearrangement of the entire system of steam mains, so that a connection of this kind will no longer be needed, and the swivels will go out of service during the present year. However, had this not been done, there is every reason to believe that they would have continued to serve satisfactorily as long as any other part of the mains. Certainly they have in almost three years of service proven so satisfactory and required so little attention that there would be no hesitation about duplicating the construction under similar conditions.

New Plant for the J. L. Mott Iron Works.

For a number of years the J. L. Mott Iron Works, Beckman and Cliff streets, New York, have maintained a large manufacturing establishment at Mott Haven, one of the suburbs of New York City. The necessities of the company having outgrown the facilities of this plant, they have purchased about 12 acres of ground in Trenton, N. J., adjoining their sanitary earthen ware manufacturing plant, which also occupies some 12 acres. There they propose to erect the best plant in the world for manufacturing not only sanitary earthen ware, water closets, lavatories, wash trays and solid porcelain bathtubs, but also enameled iron bathtubs and similar goods. In addition, they will have foundry capacity for manufacturing a variety of furnaces and ranges and such other cast iron goods as are needed to compete their extensive line of plumbing goods and supplies. The plant will also include a modern brass foundry and brass finishing shop, the house already having a well earned reputation for the excellence of design and beauty of finish of their goods designed for the equipment of the most luxurious bathrooms. In order that the new plant may be all that the company desire, and inasmuch as there is no need for any undue haste, sufficient time will be taken in the arrangement of the plant, the designing and erection of the buildings and their equipment with the special machinery that is being constructed to meet their special needs to make the works, when completed, without a rival in their line. The plant in Trenton will be admirably located between two of the largest cities in the United States, and will have the advantage of exceptionally good railroad facilities.

THE strike among the journeymen plumbers, steam and gas fitters at Bangor, Maine, was settled on July 1 by classifying the workmen and adopting a falling scale of wages. First-class journeymen plumbers and steam fitters will receive \$3 per day; second class, \$2.50; juniors, \$2 per day; gas fitters, \$2.50 per day; steam fitters' helpers, \$1.75, and metal workers, \$2.50. This scale of wages is to be continued in force for one year.

* Paper presented at the Boston meeting of the American Society of Mechanical Engineers.

Boiling Points of Water at Different Hights of Vacuum.

Not only those who do steam heating work, but all who heat water, will be interested in the table which we reproduce by permission from the catalogue of the James A. Trane Vacuum Heating Company of Chicago, giving the boiling points of water at different hights of vacuum. That it is not necessary for water to reach a temperature of 212 degrees to give off a vapor that is effective in heating is known to all who have given any study to steam heating, but to what extent a vacuum aids in such work will be better understood from the following:

Under vacuum, water boils at 98 degrees, or any temperature above. It will be seen that after the temperature in the apparatus is reduced below 212 degrees the vacuum heating system, unlike the pressure steam system, continues to supply the necessary steam for heating. Referring to the following table, compiled and presented for the first time by us, the different temperatures will be noted at which water boils under different degrees of vacuum as expressed in even inches:

Table.

Hight of mercury in inches.	Temperature. Fahrenheit.	Hight of mercury in inches.	Temperature. Fahrenheit.
0.....	212.0	16.....	175.8
1.....	210.3	17.....	172.6
2.....	208.5	18.....	169.0
3.....	206.8	19.....	165.3

Soft Coal and Water.

Water Commissioner Dougherty of New York City is in hot water, says *Fire and Water*, over this soft coal business. The citizens in the neighborhood of the West Ninety-eighth street pumping station complain of the dense clouds of smoke which roll out of the chimney of the high pressure pumping station in that street. Deputy Commissioner Long admits the truth of the complaint, but pleads that he cannot get hard coal in sufficient abundance, and if he could, he could not store it, since the station is built between two apartment houses, and, therefore, there is no space for storage. "It is a choice (he says) of using soft coal or stopping the pumps. The station supplies the entire upper West Side—that is, the high region and a large section of Harlem. A shut down would cause a terrible outcry, because then there would be no water in the houses save on the first two floors during a few hours of the night. This is the reason we decide to burn soft coal."

The Standard Boilers.

The literature prepared by Giblin & Co., Utica, N. Y., to acquaint the steam and hot water heating trade with the construction and merits of their Standard line of heating apparatus will be of interest at this season. A recent publication of the concern is a 16-page catalogue, which after giving terms and ratings explains in detail the aims of the manufacturers in their construction. The first two pages are devoted to the Little Giant steam and hot water boilers which are round in form of tubular construction and arranged either to have a rising draft or a more indirect draft, secured by means of a diving flue and a diaphragm. In either case a large surface is exposed directly to the incandescent fuel in the fire chamber, and the products of combustion are made to come in contact with all parts before finding their escape.

The Standard boiler is a round boiler made in four sizes having 18, 20, 24 and 29 inch grates, respectively,

and constructed of three pieces connected by means of push nipples. The construction presents a large fire surface and secures an indirect draft by means of a diving flue. The Standard sectional boiler of the vertical type is of the return flue and pus nipple construction, with grates having from 4 to 13 square feet of surface, and with from 101 to 248 square feet of fire surface. These boilers are all provided with grates of the anti-clinker, labor-saving type, made to be operated by means of levers, and so constructed as to be readily removed or replaced in case repairs are necessary.

A Steam Goods Catalogue.

We have received a copy of Catalogue No. 7, devoted to Powell's steam goods, manufactured by the Willam Powell Company, 2525-2531 Spring Grove avenue, Cincinnati, Ohio. The catalogue is 4 x 5¼ inches in size and consists of 145 pages, followed by a supplement consisting of 18 pages more containing valuable tables and useful information for those who use steam apparatus. The catalogue bears the announcement that it is issued in the fifty-first year of the success of the house, and that through the excellence of their equipment and superior training of their workmen, with the use of the best materials, the specialties of the concern will continue to be worthy of use by the most exacting engineers. The first section is devoted to the Star globe valve, made for either screw pipe or flanged connections, having a seat so constructed that it may be reground, and made in a variety of sizes, from ¼ inch to 6 inches. Following are Powell's hydraulic globe valves and check valves designed for high pressure; angle valves, lever throttle valves and gate valves, which form another line of standard goods of high grade. These are followed by a variety of special valves for coke ovens, for fire hose connections, for radiators in a variety of styles, also vertical and horizontal check valves and ball check valves. Another section is occupied by iron body valves, lever safety valves, pop safety valves and lubricating valves.

Thirty pages of the catalogue are devoted to an extensive variety of lubricating valves for gas engines, locomotives, air compressors, and adapted for use wherever journals and large bearings need automatic and continuous lubrication. Boiler oil feeders, sight feed oilers and multiple oilers in a variety of styles are succeeded by glass cylinder oil pumps, dynamo and motor oil gauges and cuts showing a multiplicity of oiling devices, some in connection with machines and engines to show their application. These are followed by water gauges, steam whistles, combination water columns and positive and automatic air valves and cylinder cocks. In another section are shown rough steam and gas service cocks, meter cocks, brass unions, expansion joints and a variety of special brass work. The catalogue concludes with a price-list of brass steam fittings, including elbows, tees, crosses, lock nuts, nipples, bushings, &c. For the convenience of customers a well arranged index is provided at the end of the publication.

An English Method of Heating Cars.

The Northwestern Railway Company of England, says the *Scientific American*, have equipped some of their trains with a system of heating to which the much abused term "unique" may well be applied. Two concentric cylinders are employed, the annular space between which communicates with a steam pipe extending from the locomotive boiler. The inner cylinder contains acetate of soda—a compound remarkable for its property of liquefying when heated and of cooling very slowly. The radiators thus constituted are incased in asbestos lined boxes having hinged doors. By opening or closing the door of a box the heat is turned on or off.

THE GUILDERLAND FOUNDRY COMPANY, Guilderland, N. Y., are manufacturers of Cast Iron Fittings for steam, gas and water, having been incorporated in 1900. O. Chan Wells, 10 Havemeyer Building, New York, is their direct representative, taking the entire product of the company and marketing it.

COLD AND HOT WATER SERVICE PIPING.

BY HELMAR.

In ordinary work where the bathroom is on the floor above and not distant from the kitchen, the simplest method of piping is best. Whether lead or iron pipe is used, fewer joints, less pipe and the least time are required for such. The stop cocks controlling supplies to the bathroom are placed over the sink, as shown by the accompanying sketch. The hot service is properly kept above and separated from the cold on cross runs, and the hot faucets should always be on the left side. In lead pipe jobs the hot pipe is often dipped to a point below the sink, where a long shank stop cock will just reach from the hot pipe to the sediment pipe. The trap in the hot service made by dipping, as shown, must always be provided with a drain, though it is not always connected to the waste; a pet cock will answer. It is sometimes convenient to place the hot sink faucet directly in the cross run where it will also act as a drain.

The drip from the trap in the hot service should never be connected between the sediment cock and the boiler

Cold and Hot Water Service Piping.

without a cock on it. This method will do if a cock is placed in the drip, and the cock may be left turned on or off regularly, but must be off when the faucets are repaired at the sink or the boiler will empty down to the level of the hot faucet. The trap, when the drip is thus connected, cannot be drained dry for repairs unless the hot faucet is directly on the cross line. On the whole, the connection as shown is best; it will take care of condensation of vapor from a hot boiler while a new sink faucet is being wiped in, and is preferable for general reasons, especially on lead pipe work. The sketch does not show all of them, but on iron pipe work unions should be placed on stove connections near the boiler; on both pipes over the boiler; on both pipes over the bathroom stops; on the drip to the hot service, above the cock; in the sediment pipe, on the drain side of the drip connection, and on the main cold service above the stop in the cellar.

No fixture should be set without unions or union couplings at the fixture end of the supply pipe. Liberal sized air chambers should be placed over or near all faucets. If the chambers will look unsightly, or it is difficult to place them at the faucets, extra large ones may be placed wherever they will be least in the way, but they should be located so as to get the most direct possible thrust from the water. Air chambers over the boiler help to prevent reaction at the faucets, and also lessen the concussion caused by the condensing of steam bubbles which form (usually in the water back, but sometimes in an air space which should not exist under the upper head of the boiler) when the water is extremely hot and the fire intense.

When the bathroom is on the same floor as the kitchen the service pipes are sometimes brought straight across from the top of the boiler and down behind the sink, the stop and waste cocks being placed inverted in the same position, as shown in the sketch. This gives the stops control of the sink faucets, too, which is bad, because the sink is without water when anything gets wrong with the bathroom work. It is a better plan to bring the hot water below the sink and carry both lines direct to the bathroom with stop and waste cocks placed after the branches for the sink supplies have been taken out. The waste tubes can be connected to the sink waste.

Lever handle cocks are best where unskilled persons are to use them, because it is easy to see whether the cocks are turned on or off. Those who wrangle over hair splitting points object to connecting the sediment pipe below the sink trap on account of the probability of sewer air thus entering the house at times.

The Canton Heaters.

The J. H. McLain Company, Canton, Ohio, are sending to the trade a 64-page catalogue bound in a brown cover, bearing on the front, in silver bronze, their trademark and the address of the company. The title-page gives the branch offices of the company in New York, Cleveland, Philadelphia and Indianapolis, and states that the Crane Company of Chicago are their Western selling agents, with houses in Sioux City, Kansas City, Salt Lake City, Omaha and St. Louis. After a special notice in reference to the ratings of boilers and terms, general and sectional views of the Cornell steam and Princeton hot water boilers are presented. These boilers are of the sectional type and of the return flue construction, and are made in a variety of sizes, rated to carry from 300 to 5200 square feet of direct radiation, and having grates 20, 32 and 42 inches wide.

The Princeton boiler for hot water is rated to carry from 500 to 8500 square feet of hot water radiation. The Humber and Oxford heaters for hot water and steam, which follow, are round and of the horizontal sectional type. In these boilers the smoke flues are staggered so as to secure an indirect draft, and the greatest possible heat from the products of combustion. The Cambridge and Amherst are steam and hot water heaters of a similar type. The Columbia and Lehigh are new water and steam heaters, cast in one piece, having a horizontal return flue at the top. The Sandow is a water heater well known to the trade for heating small buildings, and also for connection with large hot water storage tanks used in apartment houses. The Seneca two and three column steam and hot water radiators are shown with tables giving the complete line of sizes and dimensions in which they are made. The catalogue also shows a variety of steam and hot water radiators, valves, union elbows, corner valves, positive and automatic air valves, expansion tanks, pipe hangers, thermometers and gauges, and a number of steam fitters' supplies and specialties. Fourteen pages are devoted to tables and useful information for those who have to design and install steam and hot water heating plants.

THE UTICA HEATER COMPANY, Utica, N. Y., with branch offices in New York, Boston and Chicago, are sending out a four-page circular showing the Keystone and Imperial Steam and Hot Water Boilers. The Keystone Boiler is a combination cast iron and steel construction arranged to provide a large fire surface and an indirect fire travel. The Imperial Boilers are of the vertical sectional type, exposing a large surface through the use of the auxiliary crown sheet and securing a long fire travel through the return flue construction. The circular also calls attention to the Keystone two and three column Radiators.

JAMES R. SMITH, Mechanicsville, N. Y., bid \$1804 and secured the contract for plumbing and steam heating the County Court House and clerk's office, at Ballston Spa, N. Y.

Heating and Plumbing Notes.

THE CENTRAL FOUNDRY COMPANY, New York, have sent out notices to the stockholders that the annual meeting will be held at Exchange place, Jersey City, N. J., on July 24, at 12 o'clock, noon.

THE MASSACHUSETTS INSTITUTE OF TECHNOLOGY, Boston, Mass., has received a gift of \$5000, with the promise of \$5000 a year more for two years, for the purpose of conducting investigations in sanitary science, including the questions of the purification of water and the disposal and utilization of sewage, garbage and other wastes. The work will be carried on under the direction of Prof. W. T. Sedgwick, the present head of the Department of Biology of the institute.

F. W. MARSH, Winsted, Conn., has installed a hydraulic ram and tank for F. B. Lawton at New Hartford, and has completed a contract for gas piping, &c., at the First Baptist Church.

W. H. MORRISON, Torrington, Conn., has the heating of the new factory of the Union Hardware Company, and is at work on plumbing for the Hendey Machine Company, in that city.

A BRANCH PLANT of the Pintsch Compressing Company, manufacturers of the Pintsch Gas Lighting System, whose headquarters are in New York City, will be built in Nashville, Tenn., at once. The Pintsch gas is largely used in lighting railroad cars.

THE EPWORTH GAS LIGHT & HEATING COMPANY of Waterloo, Iowa, are distributing a little pamphlet devoted to their Acetylene Gas Generators and Automatic Gas Regulators. In addition to illustrations showing the Generators, views of a number of churches and important buildings are presented in which the Generators are installed, as well as testimonial letters from those who are using the Ideal Epworth Generator, expressing their satisfaction with its operation.

ARCHITECT F. R. COMSTOCK, 20 East Forty-second street, New York City, is receiving estimates for the erection of the Methodist Episcopal Church at Morgantown, Va., also a parsonage. The church will be 85 x 116 feet, with a tower in the center 100 feet high. The parsonage will be two and a half stories high and 30 x 51 feet in size. Both the building will require a heating and plumbing system, for which estimates are desired.

BROWNELL & DICKINSON are plumbing a nine-tenelement building for Stetson & Son, at Northampton, Mass.

THE plumbing establishment of John H. Knepper & Sons, 501 Washington street, Buffalo, N. Y., was recently entered by burglars, who carried off more than \$500 worth of fine Portable Gas Lamps, with porcelain shades and glass equipment.

THE ADIRONDACK HARDWARE COMPANY of Saranac Lake, N. Y., have the contract for plumbing the new \$100,000 Hotel Kirkwood, to be erected on the historic Camden Heights, S. C.

IN view of the strike of the journeymen plumbers of Norfolk, Va., the Master Plumbers' Association, composed of the proprietors of all the plumbing establishments in Norfolk, Portsmouth and Berkeley, Va., have voted to employ no more union plumbers.

THE STEAM APPLIANCE & SUPPLY COMPANY, 1506 Chemical Building, St. Louis, Mo., are sending to the trade a catalogue devoted to the Modoc Feed Water Heaters, Receivers, Steam, Oil, Ammonia and Vacuum Oil Separators, Expansion Joints, Chain Pipe Tongs and Clipper Rocking Grates, suitable for use under large boilers or furnaces of any type. The company also state that they are the agents for the Paul System of Heating, and several pages of the catalogue are devoted to an explanation of that system, a list of buildings being given in which the heating plant has been equipped with the Paul system.

THE WELLS BROTHERS COMPANY of Philadelphia, Chicago and New York have signed a contract to erect a \$6,000,000 heating, lighting and power plant in Chicago for the Metropolitan Heat, Light & Power Company of that city. There will be eight or ten buildings, all of heavy steel construction, covering an area of about

14 acres. These will be equipped with all the latest improved appliances and machinery necessary to a plant of the kind.

W. & B. DOUGLAS, 83 John street, New York, are distributing a 12-page pamphlet devoted to the Douglas Electric and Power Pumps. The company's triple action direct connected Electric Pump is being largely used for filling the tanks of apartment houses and similar work in all large cities where electricity is available. Any servant can work the switch to start or stop the Pump, no special skill being needed as with an engine Pump.

THE COHOES ROLLING MILL COMPANY, Cohoes, N. Y., manufacturers of Bar and Skelp Iron, have recently installed a Pipe mill for the manufacture of Wrought Iron Pipe.

AT a recent meeting of the British Gas Institute Walter Hole pointed out the saving which could be realized by using 12-foot lengths of Cast Iron Pipe in the place of the 9-foot lengths which have been the standard in England. American makers of Cast Iron Pipe have argued persistently for the change, with apparently little effect until now.

IN the United States Circuit Court at Pittsburgh, on Monday, July 7, an affidavit of defense was filed in the equity suit of the Standard Sanitary Mfg. Company against James W. Arrott, Jr., an action to compel the defendant to deliver to the plaintiff certain letters patent on improvements in dredges for pulverulent materials. The defendant says the plaintiffs were allowed by him to manufacture the articles, for which they were to pay him a royalty.

THE GLAUBER BRASS MFG. COMPANY of Cleveland have purchased the old power house of the Cleveland City Railway Company in Cleveland and will equip same for their business. The power house has been out of use since the cable railway was dispensed with, and it is one of the strongest and best looking buildings of its class in the city. The building will be thoroughly remodeled. A power plant for driving all machinery will be installed. When improvements are completed, it is claimed the plant will be one of the best equipped of its kind in the country.

DEMPSTER MILL MFG. COMPANY, Beatrice, Neb., manufacturers of Wind Mills, Pumps, Tanks, Well Machines, &c., have during the past 18 months made a number of substantial improvements in their plant by which the capacity of their foundry, machine shop and warehouses has been materially increased. They have also added a galvanizing plant. The company refer to the success which they have met in introducing their Gasoline Engine, which is referred to as a new departure as compared with most of other makes.

THE graduation exercises of the Baron de Hirsch Trade School, 222 East Sixty-fourth street, New York City, were held on Thursday night, 75 students receiving certificates at the hands of the superintendent, J. Ernest G. Yalden, who also distributed the prizes, which were tools used in the trades in which the recipients were most proficient. A. S. Solomons, general manager of the Baron de Hirsch Fund, and other members of the Board of Trustees of the school, made addresses. The sixteenth class will be admitted on August 18 to instruction in the sign and house painting, plumbing, carpentry, electrical and machinists' trades.

JOHN STOCK & SONS of San José, Cal., bid \$1732 and secured the contract for the plumbing and sheet metal work on the Mechanical Engineering Building at the Leland Stanford, Jr., University, at Palo Alto.

THE COUNTY COMMISSIONERS at Lawrence, Mass., will receive bids until July 17 for plumbing and steam heating the Court House in that city.

THE JENNISON PLUMBING COMPANY of Fitchburg, Mass., have the contract for heating, plumbing and gas fitting the new Post Office Building, to be erected in that city.

J. J. FITZGERALD & Co., Maysville, Ky., have equipped the Central Presbyterian Church in that town with a new heating system.

PHELPS BROS., 284 Pearl street, the New York representatives of the Pennington Foundry & Heater Com-

pany, Pennington, N. J., are sending out a new price-list of the Pennington M. B. M. Boilers, announcing that the company are now prepared to fill orders for the 30 Series, which have 30½-inch grates and are rated to carry from 900 to 2700 square feet of direct steam radiation. The price-list is accompanied by circulars relating to the company's Elmo Automatic Float Air Valve and the Pipe and Boiler Covering Material made by the Norristown Covering Company.

WILLIAM A. KERR, secretary of the Board of Education of Hoboken, N. J., will receive bids until August 4 for plumbing, heating and ventilating a new school building in that city.

HENRY BEUTELSPACHER, Bridgeport, Conn., is putting in new plumbing and fitting up new toilet rooms in Julius Pfau's *café* on Main street, Bridgeport.

HENRY SINCLAIR, Ridgely, Md., is issuing a little catalogue devoted to the Sinclair Manifold Steam Cooker and Heater. This consists of a well constructed Pipe Boiler designed to be inclosed in a substantial casing and connected with a horizontal steam drum at the top. The apparatus has been largely used and with satisfaction, as is shown by the number of testimonial letters presented in the catalogue. It is adapted for canning fruits and vegetables, cooking of stock feed, heating buildings and for running small engines or pumping machinery.

LEIGHTON, DAVENPORT & Co., Bangor, Maine, bid \$1462 and secured the contract for heating and plumbing the new Union Square Grammar School Building in that city.

AN inventor in Vienna is reported by the *Plumber and Decorator* of London to have succeeded in producing a glass which is practically a non-conductor of heat. When ¼ inch thick this glass is said to allow only 7 per cent. of sun-heat to pass through it, while plate glass of the same thickness allows 95 per cent. to pass. Such a glass should be excellent for the windows of dwelling houses, particularly of such rooms as have a southern exposure, or for work rooms lighted from the roof. Venetian or any sort of inside blinds are of little service in keeping out sun-heat with ordinary glass panes, but non-conducting glass would keep the apartment cooler than even outside shades can do. It should also keep rooms warmer in winter by refusing to conduct the heat out.

THE Board of Education of Spokane, Wash., have awarded the contract for heating the Irving School in that city to Smith & Proulx at their bid of \$2250, and the plumbing contract to Lambert & Reilly at their bid of \$700.

PITTSBURGH dispatches report that by a suit in the Common Pleas Court No. 2 the Standard Mfg. Company seek to restrain James W. Arrott and others from engaging in the manufacture and sale of Plumbing Supplies and Porcelain Lined Bathtubs.

THE Board of Trustees of the University of Wyoming will receive bids until July 21 for the erection of a central heating plant on the University grounds at Laramie, Wyo.

CHARLES W. BOYNTON has been appointed assistant plumbing inspector of Grand Rapids, Mich.

New Firms and Changes.

THE BALTIMORE REFRIGERATING & HEATING COMPANY, Baltimore, Md., have been incorporated, with a capital of \$1,000,000, to furnish steam and cold air by means of pipes laid in the streets.

THE IMPROVED HYDRO CARBON LIGHT COMPANY of Philadelphia have been incorporated with a capital of \$500,000, to manufacture Hydrocarbon Lamps and apparatus for heating purposes.

M. J. MCCARTHY has resigned his position as assistant plumbing inspector and entered into partnership with W. J. Hutchinson, at 520 Tenth street, N. W., Washington, D. C. The new firm will be known as Hutchinson & McCarthy. Mr. McCarthy will take charge of the plumbing department of the firm's business. Mr. Hutchinson having found it necessary to devote all of his time to the stove and furnace heating department of his business.

THE TOLEDO PIPE THREADING MACHINE COMPANY of Toledo, Ohio, have been incorporated with \$10,000 by C. F. Carroll, C. F. Collins, C. R. Clapp, W. W. Vosper, Henry R. Thompson and others of Toledo, to manufacture Pipe Threading Machines. It is likely that the company will not do their own work but will let the contract to outside concerns for the present.

M. A. MURRAY & SON are a new firm in the plumbing, steam and hot water heating and sheet metal working business, at Cold Spring, N. Y., M. A. Murray, who has been in this business for a number of years, having taken his son, Vincent A. Murray, into partnership with him. The new firm desire to receive catalogues from the manufacturers and jobbers of the various goods in their line.

THE BUCK DOMESTIC BURNER & FUEL COMPANY have been organized at Beaumont, Texas, with a capital stock of \$100,000 by A. T. Waller of Beaumont, E. E. Weeks of San Antonio and B. T. Clemons, W. W. Crookinger and J. M. Best of Cincinnati, Ohio, to manufacture devices for the use of crude and refined oil as fuel.

TRADE NOTES.

THE YOUNGSTOWN BRONZE COMPANY of Youngstown, Ohio, have been incorporated with a capital stock of \$25,000, by W. H. McMillen, Grant S. Jones, Hampton Casmer, J. W. Long and William Noll. The new company will rebuild and remodel the foundry built at 11 North avenue, Youngstown, adapting it for the production of Brass and Bronze Castings.

THE FURNITURE, STOVE & REPAIR COMPANY, with principal office at 185 Montgomery street, Jersey City, N. J., have been incorporated with a capital stock of \$500,000, by Jennie C. McKenzie, Arthur W. Wells and Aug. W. Turner.

THE GRASELLI CHEMICAL COMPANY, Cleveland, Ohio, are sending through the mails a colored postal card of Oriental design, calling attention to their Eureka Soldering Flux, which they recommend for use by tinsmiths and can makers.

THE partnership heretofore existing between J. W. Foley and F. Johannigmann, under the firm name of J. W. Foley & Co., has been dissolved by mutual consent. Mr. Foley has retired and the business of manufacturing Grey Iron Castings will be continued by Frank Johannigmann at the old stand, 629 to 637 West Front street, Cincinnati, Ohio.

SOUTH CAROLINA INTERSTATE AND WEST INDIAN EXPOSITION, Charleston, S. C., have awarded the following medals to F. E. Myers & Bro., Ashland, Ohio: Certificate No. 1054, bronze medal on Myers Glass Valve Seat Pumps, also on Hay Tools; Certificate No. 1178, silver medal on Myers Stayon Door Hangers. These awards are said to be the highest in their respective classes.

THE SUN MFG. COMPANY, Greenfield, Ohio, manufacturers of Cash Registers, Coffee Mills, Rat Traps, Wooden Ware Specialties, &c., have been obliged to materially increase their capacity in view of the demand for their products.

THE JENISON IRON & STEEL SHOPS, LIMITED, Grand Rapids, Mich., announce that they are prepared to make Sash Weights on a large scale. They have at present a capacity of about 20 to 25 tons daily.

THE INTERNATIONAL MICA MFG. COMPANY of Columbus, Ohio, have been chartered with a capital of \$500,000, to operate mines and works for smelting and to maintain factories for manufacturing Mica.

THE ST. LOUIS ENAMELING COMPANY, St. Louis, Mo., manufacturers of the Artistic Enameled Ranges, are equipped with facilities to do enameling work of any kind that may be required. They do a large business in the production of Enameled Steel Signs.

THE DAIRYMEN'S MFG. COMPANY of New York, manufacturers of Milk Cans, &c., have purchased a tract of land, 200 x 125 feet, on Warren, Morgan and Bay streets, Jersey City, N. J., for manufacturing purposes.

Putting Up Galvanized Iron Cornices.

BY WILLIAM NEUBECKER.

PART I.—CORNICES ON WOODEN LOOKOUTS.

The difference in construction of galvanized iron cornice work in different shops is quite important. Those accustomed to the methods of construction employed in the West would be very much at a loss in putting up work manufactured in the East, while those who know how to proceed with the latter would be considerably embarrassed in handling work manufactured in some of the interior towns. Variations in construction, as between different sections and different factories, prevail in other lines as well, but there is always a right and a wrong way, and where several plans are offered one is generally better than another. In this article the writer aims to call attention to some features of construction which, although not new, may be of help to some readers.

In Fig. 1 is shown a cornice constructed upon wooden lookouts, or brackets, and put up in a manner which experience has shown to be quite satisfactory. The brick work A is leveled off on a line with the bottom of the foot molding, and this member, B, is then set by means of the lookout C, and a strip of board, D, is nailed upon the top of them. The foot molding is formed with a drip, as shown at E, which is drawn tight against the wall and fastened to the lookout C by means of the strap F. These straps are made of No. 24 galvanized iron, 2 inches wide and as long as required. An angle

in place the edge B of the panel is turned over the edge A of the bracket, thus locking the two parts together, as shown at C.

Along the bottom of the panel Y, in Fig. 1, an edge is turned inward, as shown at H, which, meeting the edge turned upward on the top of the foot molding at I, serves as a gauge for obtaining a true line for the panel and a means of fastening it to the mold below. The two flanges are then locked together, as shown at I, and tacked with solder at intervals, thus securing a water tight joint. After the panels have been placed in

Fig. 2.—Locking the Panels.—Section through X Y in Fig. 1.

position in this manner the brick work may be carried to their top. In case the panels are very high straps should be riveted to them at intervals and secured to the brick work, thus holding them in position.

When the brick work has been carried to the top of the panels the dentil course, into which the dentils K had been fastened before the work was hoisted to the top of the building, is put in position. The lower edge of the dentil course fits back against the edge which has been bent on the top of the panels, as shown by J, thus forming a gauge by which it may be readily placed, and also forming a means of joining the two sections together from the back, which is done as described in connection with the foot molding.

After the dentil course has been placed in position the brick work and lookout may be carried to the top of it, as shown, when the strap L is riveted at M and nailed at L. In practice it is better to fasten the mo-

Fig. 3.—Locking the Planceer.—Section through U V, Fig. 1.

dillions A¹ against the modillion course on the ground, leaving the planceer *c d* loose, to lie flat upon the modillions and the brackets, and to be fastened in position afterward, rather than to fasten it upon the moldings on the ground. Thus the modillions A¹ can be riveted, as at *a*, on the ground before the molding is hoisted, or they can be riveted from a scaffold when putting up the work on the wall, in the same manner as the flange *b* of the bracket is riveted. Slight irregularities will occur in work of this kind, and it is therefore better to place the planceer on the modillions and brackets after they are in position, when it can be shifted one way or the other, as may be necessary to provide a straight line along its outer edge, against which to hook the crown molding at R.

The planceer, it will be noticed, is locked to the modillion course at N, strapped to the lookout W at P and O, and riveted to the planceer at *c* and *d*. Along the outer edge of the planceer an edge is bent upward, as shown at 2. The planceer may be joined to the modillions and brackets by cutting through the center of them and turning down the edges and bending them around so as to clinch with the edge in the top of the modillions and bracket, as is shown in Fig. 3, in which A is the cap of the bracket, with the edges of the cap bent inward, as shown at B. U V represents the planceer, cut out in the center, with edges bent downward as at C, after which it is clinched as at D. Instead of cutting out the entire size of the modillion and bracket, and joining in this way, only a portion of the iron

Putting Up Galvanized Iron Cornices.—Fig. 1.—Putting Up on Building on Wooden Lookouts with Locked Joints.

of 1 inch iron is riveted or soldered to the foot mold, and the top is nailed to the wooden lookout C at F. The object of the board upon the top of the lookout is to provide a solid base for the foot of the bracket G.

After the foot molding has been put in place the brick work is carried up to the top of it between the lookouts, and then the bracket G is put in place, being fastened temporarily in a plumb position by any means most convenient, the usual method being to solder the foot of the bracket directly to the top of the foot molding, and then, by a wire attached to the top of the bracket, to fasten it to the wall temporarily. The panels X and Y are next placed in position, and are fastened to the bracket G by means of a locked joint, as shown in Fig. 2, which is a section through X Y in Fig. 1. G, in Fig. 2, represents the bracket, on which the edges are bent inward on the sides, as shown by A, while the edges are turned outward on the ends of the panels, as shown by B. After a panel has been slipped

should be cut away, so as to leave as much strength in the planceer as possible.

The next step is to place in their position, in Fig. 1, the main lookouts W W W. The last operation in putting up the cornice is to hook on the crown mold, as is shown at R. The strap T is riveted to the ogee of the molding at c, and fastened to the lookout at T. A lock is placed at S to connect the roofing. While some cornice makers have different ways of putting up this class of work, this method gives good strength in the joints and makes a water tight job, as it allows for expansion and contraction, and no nails are driven into the face of the cornice.

No cornice maker who has pride in the quality of his work will allow a cornice to be simply nailed to the face of the wall, for it will bring reproach upon the sheet metal cornice trade, and will have an appearance which is anything but satisfactory to the owner or a recommendation to the cornice maker. It often happens that work is fastened to the outside, after the walls are up, because the cornice was not done on time, which is a poor excuse, when the quality of work is taken into consideration.

(To be continued.)

FORMULAS FOR DETERMINING THE CAPACITIES OF VESSELS.

BY F. W. RUDD.

Tinsmiths, plumbers and others who are called upon to make vessels of a given capacity, or to determine the capacity of vessels of a given dimension, will be interested in the formulas which I have worked out for my own convenience, and which, I think, will be found accurate enough for ordinary use. The information is more readily expressed by means of formulas, and the following key explains all of the letters used in the different formulas:

Key to Letters Used in all Formulas.

D, Large diameter.	W, Width.
d, Small diameter.	L, Length.
H and h, Hight.	V, Volume.

For Cylinders.

Volume in pounds equals $d^2 h \times 0.028407 +$.

For Cone.

Volume in pounds equals $d^2 h \times 0.009469 +$.

For Frustum of a Cone.

Volume in pounds equals $h (D^2 + D d + d^2) 0.009469$.

For a Sphere.

Volume in pounds equals $D^3 \times 0.0189386 +$.

Dimensions for above formulas to be taken in inches and decimal parts of an inch. Products found thereby represent capacities of the various shapes as if they were filled with water. These products multiplled by the specific gravity of various articles will give the capacities of the various substances—that is, weight of capacities

Dimensions of formulas below to be in inches and decimal parts of an inch.

Volume in gallons is found in following formula:

For a Sphere.

Volume equals $D^3 \times 0.002267$ (liquid standard).

For Frustum of Cone.

Volume equals $h (D^2 + D d + d^2) 0.0011333$.

For a Cylinder.

Volume equals $D^2 h \times 0.034 +$.

For Rectangular or Square.

Volume equals $W \times L \times H \times 0.004329$.

In barrels of 31½ gallons formula reads:

Volume equals $D^2 H \times 0.0001079 +$.

Rectangular and Square.

Volume equals $W \times L \times H \times 0.000137$.

Formula for dry measure, giving product in quarts and decimal parts of a quart:

For Cylinder.

Volume equals $D^2 H \times 0.01168$.

For Rectangular and Square.

Volume equals $W \times L \times H \times 0.01488$.

The decimal factors in the above formula divided by 8, 16 and 32 will give the factor to be used for pecks, half bushels and bushels, respectively.

Brooklyn Metal Ceilings and Side Walls.

The Brooklyn Metal Ceiling Company, 283-287 Greene avenue, Brooklyn, N. Y., have just issued Catalogue No. 9 covering their metal ceilings, side walls, &c. The publication is one of 72 pages, 12 x 9 inches in size, and is profusely illustrated with exceptionally good half-tone engravings. For the benefit of foreign buyers, translations of the English introduction to the catalogue given in French, German, Spanish and Italian. In the first part of the catalogue directions are provided for applying metal ceilings, with diagrams and other useful data. A feature of the company's product, to which special attention is called, is the method of finishing their metal panels in imitation of various marbles, obtaining a very fine effect. This work is claimed to be finished in a durable manner, being baked on the metal and not being liable to chip or flake off with ordinary wear. The imitations of genuine marble are very naturally produced, illustrations being given, showing panels finished in imitation of Tennessee, Sienna and Brocatel marbles, also of black and white marble, as well as some especially handsome effects in imitation of onyx. The company also make a line of enamel metal tiling in the various enameled tile finishes, including all shades, colors and mottled effects. These goods are of the same quality as their marble finishes, and are claimed to be more effective than enameled porcelain tile, as they are embossed and have a richer appearance. They are particularly recommended as an elegant wall or ceiling covering for bathrooms or stores. The nails for the marble and tile finishes are also coated, and it is said can be driven without injury to the finish. These goods are stamped up after they are finished, which gives an idea of their toughness and durability.

The catalogue contains a number of interior views showing the effects produced by the company's ceilings and side walls when placed in position. Among the illustrations are panels in Colonial, Rococo and Empire styles, also girder covers, side walls, center pieces, borders, friezes, wainscoting, coves and cornices, crown moldings and stamped ornaments of various kinds, together with metal tiles and bricks. The last pages of the publication are occupied by an index and price-list, with a telegraphic code for the convenience of customers who wish to order goods by wire. The company are also manufacturers of fire proof dumb waiter doors, covered entirely with sheet steel.

The Situation in the Welsh Tin Plate Industry.

Since the Conciliation Board came into existence in the Welsh tin plate trade three years ago wage contracts have been entered into annually, and the existing contracts end on June 30. It is claimed that the three past years under conciliation have been a period of absolute freedom from serious strikes. Masters and men have brought into existence a Wage Dispute Board. This board appeared to be doing good work and making good headway until a few months ago, when the Duffryn mill men, members of the Smelters' Union, presented notices without consulting the board. The union demand for receiving payment on "area" caused some resentment among the employers, though they eventually agreed that payment should be, as asked for, on area pure and simple, the effect being to accord an advance in wages of some 2 per cent. on about 3,000,000 boxes of plates. "Canadas" and "doubles" had always been paid for exceptionally—that is, the men did not work a box up to the standard of 31,500 square inches per box on those sizes. The employers asked the men to give this up and to accept payment on area on these exceptional plates, but the men refused, and hence the dispute.

CHARLES MCSHERRY has started a general machine shop on Fifth avenue, Pittsburgh, and will build labor-saving metal working machinery and tools. Mr. McSherry is the inventor of the Hercules shears for the cutting of sheet metal of heavy gauges, and for which he is having a very large demand.

PATTERN FOR A WASH BOILER.

A wash boiler with a flat bottom, such as is shown in Fig. 1, is an article that the tinsmith is occasionally called upon to make on a special order. This is often made of IX tin with copper bottom, and sometimes entirely of 16 or 18 ounce cold rolled copper. Knowing the size of the boiler, a plan of the same is drawn, as shown in Fig. 2, in which A C is the length and B D the width, the semicircular ends being struck from the centers *a* and *b*. Edges allowed to this plan, for double seaming, will give the pattern for the bottom. The pattern for the body is usually made of such height as to avoid any waste in the metal, after the edges and wire have been allowed for; the length being obtained by taking a stretchout around the plan.

The part to which special attention must here be given is the pitched cover, which is developed on the principles of developing a scalene cone. As both halves of the cover are symmetrical, only one-half of the pat-

Pattern for a Wash Boiler.—Fig. 1.—Perspective View of Finished Boiler.

tern will be developed. Through the center *a* in plan, at right angles to *a b*, draw the diameter 1 1, as shown. Directly above the plan draw an elevation of the cover, giving the required rise J F, as shown, and draw the lines F E and F G. Divide the semicircle 1 A 1 in plan into an equal number of parts, as shown by the small figures 1 to 1, and from these points draw lines to the apex F.

F E in elevation represents the true length on the line F¹ A in plan, and before the pattern can be obtained a diagram of triangles must be constructed giving the true lengths on each of the other radial lines in plan, which are obtained as follows: With F¹ as center and with radii equal to F¹ 1, F¹ 2 and F¹ D draw arcs inter-

Fig. 2.—Plan, Side View of Cover and Diagram of Triangles.

secting the center line A *b* in plan at 2', 1' and D¹ respectively. From these points, at right angles to A *b*, draw lines intersecting the base line E G in elevation at 3'', 2'', 1'' and D², from which points draw lines to the apex F. Then will these lines represent the true distances on similarly numbered lines in plan.

Now, with radii equal to F 3'', F 2'', F 1'' and F D² and with F in Fig. 3 as center describe the arcs 3, 2, 2, 1 1 and D D. From the center F draw the vertical line F 3, intersecting the arc 3 at 3. Now set the dividers equal to the distances 3 to 2, 2 to 1 and 1 to D in plan in Fig. 2 and, starting from the point 3 in Fig. 3, step from one arc to another having similar numbers, thus

obtaining respectively the points 3, 2, 1, D on both sides. Trace a line through the points thus obtained, as shown by F D 3 D F, which will be the half pattern for the cover, to which laps must be allowed for seaming. The handles shown on the boiler and cover in Fig. 1 are

Fig. 3.—Half Pattern of Cover.

made with hem edges *a* and *b* in diagram X in Fig. 3. They are then riveted to the boiler and cover and soaked with solder.

Combination of Sheet Metal Working Machinery Concerns.

The Universal Machine Company, Canton, Ohio, who are pioneers in the manufacture and invention of long length conductor pipe, long length chain pump tubing and long length eave trough machinery, and who are also the original inventors and manufacturers of wire eave trough hanger machinery, have combined their business with that of the Canton Foundry & Machine Company, a large and prosperous concern employed in the manufacture of heavy and light castings for all purposes. The combined company are erecting large new machine shops adjoining the foundry and installing therein a full equipment of the most modern and improved machinery. The factory is centrally located in the city of Canton, on both the Pennsylvania and Wabash Railroad systems, and is close to all freight depots. The company are therefore in the best position to serve the numerous factories in their own city, and especially the sheet metal concerns, for which Canton is noted, and for whom they do a large amount of machine work. The Universal Machine Company number among their customers all the manufacturers of conductor pipe and eave trough in the United States, besides those in many other countries, as well as many sheet metal working concerns. By their new additions they will be enabled to serve their customers better than ever before, and if the demand for their products calls for it they will extend their line of regular machines as rapidly as possible, while at all times giving their closest and most prompt attention to inquiries for special sheet metal working machinery. The two partners in the Universal Machine Company, R. F. Fowler, who is a practical machinist, and William S. Yohe, who acts as secretary, are largely interested in the new company, and inquiries or orders will continue to receive their personal attention, when addressed to the Universal Machine Works or the Canton Foundry & Machine Company. The new company will continue to manufacture the Imperial hot air furnaces, hitherto made by the last named company.

THE CORTRIGHT METAL ROOFING COMPANY, 50 North Twenty-third street, Philadelphia, with Western office at 134 Van Beuren street, Chicago, have recently added to their equipment a large kettle or tank for galvanizing their Metal Slates and Victoria Shingles. These goods have become very popular in some parts of the country, because they require no paint to preserve them. The company's method is to take the Metal Slates or Shingles, which are stamped out of tin or terne plates, and after stamping to galvanize them, which insures a thorough coating, leaving no raw or cracked edges exposed. The company are prepared to send samples of these goods free to architects, contractors or roofers or any others who are interested in roofing work.

NEW INDEPENDENT STEEL WORKS AT CANTON, OHIO.

An open hearth steel plant and a blooming mill are to be erected at once in Canton, Ohio, at a cost of about \$500,000. The project is the outcome of the efforts of Edward Langenbach, who has been working upon this scheme for some months past. The prime movers in the enterprise, in addition to Mr. Langenbach, are J. E. Carnahan, Joseph Biechel, W. N. Irwin and William Blecker, who are interested in the Berger Mfg. Company, the Carnahan Tin Plate Company and the Stark Rolling Mill Company of Canton. These gentlemen will control the larger part of the capital stock of \$500,000 with which the new company will be incorporated. The title of the new concern will be the United States Steel Company, and a charter will shortly be applied for. Some outside capital has been invested, principally by Cleveland, Ohio, capitalists, including interests connected with the Cleveland blast furnace. Plans of the new plant have been drawn by Victor Buetner of Pittsburgh, and the contracts have all been closed for its speedy construction. A site of 10 acres has been secured adjacent to the Berger works, and their allied industries in Crystal Park, Canton.

The company will erect a new steel works to include a number of modern open hearth steel furnaces with a capacity of about 50 tons each, also a rolling mill, a universal plate mill and the necessary equipment for making sheet bars for the independent sheet and tin plate mills. The principal object sought by the promoters is to provide some of the independent sheet steel manufacturers with another source of supply of billets and sheet bars. Many of these manufacturers of late have found it difficult to obtain their supply of raw material from the United States Steel Corporation or any of the other steel makers. The contracts call for the completion of the mills by March 1, 1903. The plant will have a capacity of 12,000 to 15,000 tons a week, and will employ not less than 400 men. The plans include an open hearth furnace, 69 x 400 feet, and a blooming mill, 40 x 300 feet. In addition to these there will be a gas producer and power house.

The creation of this steel works will make the group of industries which center around the Berger Mfg. Company entirely independent in the matter of their supplies of raw material. The managers of these Canton industries have for some time been considering plans for the enlargement of several of the plants, but hesitated to put these plans into operation while there was any uncertainty in regard to the supply of steel. They now propose to go ahead and carry out these plans for enlargement, which have been rendered necessary by the rapid growth of their business. The Stark rolling mill and the Carnahan tin plate mills are at present undergoing their annual overhauling and repairs, and a number of improvements are being made in these works and the other industries which cluster around the Berger works.

The Perfect Elbow Patterns.

With the view of satisfying the steady demand for some method of securing patterns for elbows of all angles, G. L. Gray, Galesburg, Ill., is offering for sale, in two sets, patterns for making elbows of all sizes, from 1 to 20 inches in two, three, four and five pieces, and in all sizes from 20 to 40 inches made in five, six, seven and eight pieces, a total of 160 patterns. A small blue print sent out by Mr. Gray, showing a picture of an ordinary tinsmiths' bevel, calls attention to the various angles for which the patterns will enable the tinsmith to cut out elbows. It is claimed by those who have secured sets of these patterns and have used them that even if every tinsmith was a pattern cutter his time would be too valuable to stop and make the pattern every time an elbow of special diameter or odd angle was needed. The small chart showing the different angles for which elbows can be made is found of great benefit, particularly to furnacemen, as they can see at a glance just what pattern should be used and the number of pieces required to make an elbow of the angle

shown. In addition to elbow patterns, Mr. Gray is prepared to furnish patterns for hip, gable and single pitch skylights. All of these patterns are made on heavy blue paper, and when kept in a tin cylinder will not become destroyed by wear and can be retained clean and free from dust.

FLASHINGS.

THE JACKSON IRON & TIN PLATE COMPANY were compelled to temporarily close their works at Clarksburg, W. Va., last week, on account of an accident at the power plant. The company are manufacturing Coke Tin Plates almost exclusively. Their equipment consists of a Bar mill, eight Tin mills and five cold mills, with a tinning department containing 12 tinning machines. C. C. Moore is the general manager of the concern.

GEORGE D. EVANS, formerly manager of the Carnahan Sheet & Tin Plate Company's mill at Canton, Ohio, in connection with a number of Lisbon and Canton capitalists, proposes to build a \$200,000 Sheet mill at East Liverpool, Ohio.

THE BUCKEYE STAMPING COMPANY of Columbus, Ohio, have been organized with \$20,000 capital, to manufacture Tin Cans, Tin Boxes and Sheet Metal Specialties.

THE BINDLEY HARDWARE COMPANY, Pittsburgh, Pa., have the contract for roofing the new plant of the Burns Uniform Steel & Metallic Company, at Latrobe, Pa. They also have the contract for roofing the new \$1,000,000 plant of the Pittsburgh Packing & Provision Company, at Herr's Island.

THE WHITAKER IRON & STEEL COMPANY, Wheeling, W. Va., are adding three new Sheet mills to their plant, which will give them a total of 11 mills.

THE GEORGE P. SCHMIDT COMPANY, 1020 East Ohio street, Allegheny, Pa., have applied for a charter of incorporation to conduct a Sheet Metal working business. The incorporators are George P. Schmidt, Herman R. Schmidt, Edward C. H. Schmidt and John Feldheimer.

WE are advised by the Smith-Warren Company of Boston and New York that among a number of other orders received in the past few weeks for H. Collier Smith's Patent Shutterless Automatic Closing Fire Proof Metal Windows are the following: The Young, Smythfield Company's new store at 1220 Arch street, Philadelphia; the new factory for Jacob Bchrend at 122 West Allen street, Philadelphia; Jones, Morgan & Co.'s new store at Waterbury, Conn.; H. O. Wilbur & Sons' new factory at Bread and New streets, Philadelphia; a new warehouse for Binswanger & Co., at Richmond, Va.; a new factory for A. Schoenhut & Co. at 2162-66 Adam street, Philadelphia, and the Essex County Court House, Lawrence, Mass. The Smith-Warren Company, who control the patents for these Windows have recently closed a manufacturing agents' contract with McFarlane & Douglas, proprietors of Crown Cornice Works, Ottawa, covering the provinces of Ontario and Quebec, Canada. The company are just issuing a new catalogue and will be pleased to send copies upon request.

THE JUNIATA STEEL & IRON COMPANY, Green Castle, Ind., have awarded contracts for the tin house equipment of their new mill to the Anderson Foundry & Machine Company, Anderson, Ind.

THE WATERBURY BRASS COMPANY of Waterbury, Conn., with New York office at 122-130 Centre street, are giving special attention to the production and carrying in stock of Copper adapted for cornice and roofing work. They carry a large stock in their New York warehouse and are capable of filling orders of any size promptly. The company also have Soldering Coppers of all sizes and shapes, adapted for the use of tinsmiths, cornice men and sheet metal workers. A stock sheet, with the prices of this line of goods, can be secured on application.

THE AMERICAN CAN COMPANY have decided not to rebuild their plant at Toledo, Ohio, which was recently destroyed by fire.

It is expected that all departments of the W. H. Griffiths Charcoal Iron Mills, Washington, Pa., will be

started up within a few days. The plant consists of two Tin mills, a Tin house and charcoal forge.

HENRY F. AKIN, vice-president of the American Can Company, died on July 4 at the Waldorf-Astoria Hotel after an illness of three weeks from typhoid fever. He is survived by a widow and one son, a cadet at West Point.

THE Building Committee of the new City Hall at Ansonia, Conn., will receive sealed proposals until July 22 for the erection of the proposed structure. Bids will be received for the entire work, or the steel work and Metal Ceilings may be estimated separately.

PAUL BERTIN-MOURET, a French Tin Plate manufacturer, has been making a tour of the various large industrial plants in the Pittsburgh district.

THE following named concerns are among those who have signed the Amalgamated Association scale: Youngstown Iron, Sheet & Tube Company; Neal Bros., Pittsburgh, Pa.; Ohio Rolling Mill Company, Findlay, Ohio; American Rolling Mill Company, Muskegon, Mich.; Niles Sheet Mill Company, James A. Patterson, president, Niles, Ohio; the N. G. Taylor Cumberland Black Plate Mill, Cumberland, Md.; Sharon Tin Plate Company, Sharon, Pa., and the Empire Rolling Mill Company, Cleveland, Ohio.

OFFICIALS of the Amalgamated Association of Pittsburgh will make the bi-monthly wage adjustments next week. In the Tin Plate and Sheet scales the selling prices of the past two months will not warrant any advance to the men. In the puddling and bar iron scales it is possible the average price of shipments of iron bars in May and June may warrant a slight advance to puddlers and finishers, but this is not certain.

KRAMER BROTHERS, Dayton, Ohio, are drawing attention, by means of illustrated leaflets, to their Dayton and Gem Swing Chimney Tops, made in diameters of from 4 to 24 inches, and adapted for use with any size of stock.

The New Climax Bi-Treadle Grinder.

The new Climax bi-treadle grinder, shown herewith, is made by Schofield & Co., Freeport, Ill. The motive

The New Climax Bi-Treadle Grinder.

power used may be varied by changing the belt from the balance wheel to a pulley. The crank shaft bearing is adjustable on the center post, so the belts can thereby be tightened. All bearings are fitted with dust proof oil cups. The rest support is adjustable to any position on the center post, or can be taken off instantly if desired to leave the space about the wheel clear for convenience in polishing or buffing. The bearings for both mandrel and crank shaft are long pipe bearings and accurately fitted so the machine runs with the least possible friction.

The matter of public comfort stations is beginning to make some progress in New York City. Plans were approved this week for eight of these stations to be built in the Borough of Brooklyn. The largest, an underground one, will be located north of the Borough Hall, and will be similar to the one in the City Hall Park, Manhattan. The other stations will be on the street level.

The Modern City House.

One of the tendencies of the times in connection with the equipment of the private residences of the wealthy is to have a bathroom for every sleeping room. A case which illustrates this very well is related of a prominent architect who some 15 years ago designed a city residence for a client in which there was one bathroom; seven years later he designed another house for the same man in which there were three bathrooms, and during the past year a modern residence was planned for this man in which there were 15 sleeping rooms and 15 bathrooms. In the thoroughly up to date city residence the telephone has taken the place of the speaking tube for inside use, and there is both a local and regular telephone service, which is installed in chambers, library and halls. Electric "push buttons" for servants and for lighting are now common features, while the electric automatic elevator is a necessary adjunct of the modern city house.

New Swedish Kerosene Burner.

United States Consul Bergh of Gothenburg, Sweden, reports that a promising invention has been made by Auders Lindgren of Karlstad, who has constructed a kerosene burner which, while resembling the Auer burner, needs no pressure of carbonic acid to press up the oil and bring about its gasification. The oil is drawn up into the burner by a common wick, passes to a little ring-shaped wick, and burns with a steady and pleasant light, which also has the advantage that it is generated noiselessly. The consumption of kerosene by a lamp of 125 candlepower amounts to only 0.5 to 0.6 ore (0.134 to 0.16 cent.) per hour. Application for patent has been made in Sweden and will be made in other European countries and in America.

New Publication.

Steam Heating and Ventilation. By W. S. Munroe, M. E. Published by the *Engineering Record*, New York. Price, \$2. Size, 6 x 9½ inches; 150 pages and 90 illustrations.

The work consists of a revision for publishing in better form of a series of articles which have appeared in the *Engineering Record*. It opens with a few references to the first installations of steam heating apparatus in the early part of the last century. The first portion of the book is devoted to systems of piping and steam supply, with the various appliances for both low pressure and exhaust steam heating, followed by methods of radiator connections, and tables in reference to their efficiency for both direct and indirect radiators. Later pages are devoted to piping constructions and tables, and include plans of buildings in which the system of piping is shown and explained. Mechanical ventilation, with formulæ, is followed by descriptions of systems in operation, and methods for calculating the size of ducts and the fan required for given work, showing pictures of a hot blast plant with the fans, heaters and distributing ducts. The work closes with a well arranged index.

The Bureau of Statistics of Labor of the State of Massachusetts has just published a report containing comparisons between the Federal census of 1900 and the statistics of the State of Massachusetts for 1895, which show some remarkable changes in the industries of that State during the five years. The number of industrial establishments increased from 26,265 in 1895 to 31,953 in 1900, a growth equivalent to 21.66 per cent. The greatest gain is shown in the division of metals and metallic goods, in which is an increase of from 2209 establishments in 1895 to 3053 in 1900. Machines and machinery increased from 660 to 901 establishments in the same period. All of the industries in the State increased in the value of their products 21.82 per cent. in the five years.

It is claimed that natural gas has been struck by the Cramp Steel Company within a mile of their plant at Collingwood, Canada.

THE LETTER BOX.

Inquiries in regard to practical questions of general interest are invited, in reply to which we shall be glad to receive suggestions and information from our readers.

Correspondents are requested in all cases to give their names and addresses, which will not, however, be published or disclosed without their consent.

OBLIQUE INTERSECTION OF HORIZONTAL MOLDING WITH ROOF.

From H. A. McE., Chattanooga, Tenn.—I should like to have you publish in *The Metal Worker* the method of obtaining the pattern for a level molding running at an

into the same number of equal parts respectively, as shown by the small figures. From the several points and angles in profile T carry lines at the required angle with K L indefinitely, as shown, and from the points in profile S carry lines horizontally, intersecting the roof line, as shown between A and D. Finally, from the several points of intersection just obtained drop lines vertically into the plan, cutting lines of corresponding number. Lines connecting the adjacent points of intersection, as shown from F to P, will give the required plan of the intersection or miter.

To obtain the pattern a stretchout of the profile may now be set off on any line, as M N, drawn at right angles to the lines of the molding in plan, as shown by the small figures on M N. From the points so obtained on

Oblique Intersection of Horizontal Molding with Roof.

angle of 45 degrees against a roof of one-third pitch, as per inclosed sketch.

Answer.—In the accompanying diagram A B C D represents the elevation of the molding, whose profile is shown at S, and A E the pitch of the roof against which the molding is required to miter; while F G H J, the plan of the molding, shows that it is placed at an angle of 45 degrees with K L, representing the eaves of the roof or any horizontal line drawn upon the roof surface.

Before the pattern can be developed a plan of the intersection of the mold with the roof surface must be obtained. Therefore, first draw a duplicate of the profile S in the plan, as shown at T, placing its vertical lines at the required angle with K L, and its face toward the front of the plan corresponding with the elevation, and divide the curved portions of both profiles

M N draw the usual measuring lines parallel to F J indefinitely, and from the several points in the plan of the miter F G P project lines at right angles to F J, cutting measuring lines of corresponding number, as shown between U and V. A line traced through the several points of intersection will give the required miter. The complete pattern is shown by U V W X, which may be extended beyond W X to suit convenience.

WHO MAKES PENZY COAL COOK STOVES?

From Marx & Neun, St. Louis, Mo.—Will some one tell us who makes a hard coal cook stove called Penzy? We do not know if this is the name of the stove or the name of the maker. A friend lived in New York and used a stove by that name.

COPPER FOR SMOKE PIPE?

From W. J., Brooklyn, N. Y.—I desire information as to the durability of copper smoke pipe where anthracite coal is used. The pipe in this instance is to be placed in the vent flue and the smoke travels about 10 feet before entering the pipe. I feel certain that the heat will not damage it, but would like to know what experience others have had with copper smoke pipe. The information I most desire is this: What action has the soot of anthracite coal on copper? I know the soot contains sulphur and an acid that may be set free when the soot becomes damp.

IS BOILER IN BATHROOM GOOD PRACTICE?

From W. J. S., Tinsonburg, Ontario.—I would like to ask a question in reference to a simple job of plumbing. Is it good practice to place a range boiler in a room above the kitchen where the range is located? The only pressure for supply is derived from a tank 7 x 4 feet and 16 inches deep. How much higher than the boiler should the tank be placed?

Answer.—It is not uncommon to locate a boiler in the room above the kitchen, so as to derive some benefit in winter from the heat in the room in which it is placed, particularly if it is a bathroom. The small amount of heat lost by the water circulating through the pipes connecting a boiler with a water back is insignificant. The higher the supply tank is above the boiler the better will be the flow of the hot water at the hot water faucet. If the bottom of the tank is but 2 feet above the top of the boiler the pressure exerted at the top of the boiler will be about 1 pound, and if the boiler is connected with a large stove that is fired hard it is possible that steam might be generated in sufficient quantity to hold back the water from the supply tank and stop the flow from the boiler. With this information our correspondent can probably decide for himself the advisability of arranging his plumbing as he proposes.

HEATING ON BOILER LEVEL WITH STEAM.

From I. R., Norwich, N. Y.—Will *The Metal Worker* please explain the best possible method of installing a steam heating system of the low pressure type where the boiler will have to be placed on the first floor, which also must be heated by the boiler?

Answer.—Our correspondent gives too few particulars in reference to the building in which the heating system is to be installed to secure anything like a satisfactory answer. The heating surface, for instance, might be placed on the ceiling of the story on which the boiler sets. Then the condensation would run into the boiler by gravity. Again, the heating surface might be placed as usual and a sufficient pressure carried on the boiler to secure the operation of a return steam trap, or pump, to collect condensation from the radiators and throw it into the boiler. Without further details, however, it is impossible to give a more satisfactory answer.

A DEEP WELL PUMP NEEDED.

From H. L. N., Hamilton, Pa.—I have a pitcher pump in a cistern that has to raise water 26 feet through a 1½-inch pipe, and the pump works very hard. What kind of a pump should I get in order to have one that would work easy and give a good flow of water?

Answer.—The lift mentioned is just a little beyond the easy working capacity of an ordinary pitcher pump, and a deep well lift pump should be substituted for it. Pumps of this character have the cylinder located several feet below the level of the ground. A portion of the lift is due to the atmospheric pressure forcing the water up inside of the suction pipe to satisfy the tendency toward a vacuum, and if the cylinder is not more than 15 to 20 feet above the water, the water will have to be lifted the balance of the distance by a mechanical lift, through the effect of the valve of the cylinder. Pumps for this work are constructed so that there is a better

leverage at the pump handle, and, in consequence, while doing a larger amount of work, they do not seem to require quite so much power in operation.

POLISHING ZINC.

From F. S., Adams, Mass.—Will *The Metal Worker* kindly inform me what to use to keep zinc polished?

Answer.—A reliable receipt book says that zinc is generally cleaned by scouring with sand and powdered pumice. The bath used for brass, which is also effectual for zinc, is composed of 1 part nitric acid and 1 part sulphuric acid. The zinc must be washed off with clean water immediately after the bath. For large articles which cannot be dipped in the bath of acid and water apply a solution of potassium, ammonium and tartrate, thickening with sufficient clay to make a soft paste. After a few hours, rub the article with a brush dipped occasionally in fine sand, moistened with a pickle. Then polish with powdered charcoal or Vienna lime. After the zinc has been cleaned a good way to preserve its bright appearance is to give it a thin coat of some transparent varnish.

A simple way of cleaning zinc for household use is to put a teaspoonful of oxalic acid in ½ pint of water, which is ready for use when dissolved. It is only necessary to apply the wash with a sponge or soft flannel cloth to the zinc. As soon as all dirt and discoloration are removed by the action of the acid the zinc should be washed quickly with plenty of clean water. As soon as it is washed it should be rubbed dry and polished with dry whitening. It may be mentioned that elbow grease is quite a factor in securing a satisfactory polish. The strength of the wash can be varied according to necessity. A former correspondent says that he has cleaned zinc by this latter process for 35 years and can testify to its usefulness.

SHOULD CONSULT EXPERT.

From Inquirer, Cincinnati, N. Y.—Will *The Metal Worker* advise me if a small one and a half story house can be heated from a kitchen range boiler? The rooms are six or seven in number and all small, being only 7½ feet in height. I have no experience in either steam or hot water heating and cannot judge whether such a thing would be advisable if it can be done. If this is not possible, what would it cost to install a hot water heating system in this house, providing the space to be heated is not over 20,000 cubic feet? Can the boiler be set on the first floor of the house, or must it be placed in the cellar? For convenience, I would like to place the boiler in the cellar way, if an extra boiler would be required for the purpose.

Note.—It would be impracticable to attempt to heat so many rooms from the ordinary kitchen boiler. Under the circumstances it would be much better to use a special hot water boiler for the purpose. This may be set on the same floor with the radiators, but better circulation and service would be secured if it could be placed on a lower level. We should advise our correspondent to employ an expert to measure up the glass and wall surface to determine the size of the radiators needed, as calculations made from the cubic feet of space alone are not as safe as when the character and amount of the wall surface and the glass surface are considered. The expert will also be needed to determine the best way to run the flow and return pipes for the hot water heating system. The cost of the plant can only be estimated safely after the building has been studied.

Sealed proposals will be received at the office of the Supervising Architect, Treasury Department, Washington, D. C., until July 16, for furnishing and delivering Post Office lock boxes for post offices in public buildings under the control of the Treasury Department during the fiscal year ending June 30, 1903. Drawings and specifications may be obtained by applying to James Knox Taylor, Supervising Architect, Treasury Department, Washington, D. C.

TRADE REPORT.

MARKET SUMMARY.

Pig Tin is about $\frac{3}{4}$ c. higher, but dull.
Copper is quiet and slightly firmer.
Pig Lead is quiet and steady.
Spelter continues scarce and high.
Antimony is quiet and unchanged.
Nickel is in good demand and without change in price.
Aluminum is firm and in good demand.
Tin Plates are quiet, with prices a little less firm.
Black Sheets are unchanged, with large demand for Heavy Sheets.
Galvanized Sheets are dull and not so firm.
Old Metals are quiet and unchanged.
Foundry Iron is very scarce and prices nominal.
Sheet Copper is in good demand and firm in price.
Sheet Zinc has not changed; demand is moderately active.
Hardware prices are strong in all lines, with advancing tendency in some.
Stoves have been advanced 10 per cent. in price by Southern makers and 5 per cent. by Western manufacturers.
Plumbing Goods are in fair demand, with prices very strong.
Wrought Iron Pipe is scarce and high.
Wire Nails are in light demand; prices unchanged.
Cut Nails are quiet and without change.
Window Glass is moving rather slowly; prices are unchanged, but may advance.
White Lead is in fair demand and firm in price.
Spirits Turpentine is 2c. per gallon lower, and dull.
Linseed Oil is firm and higher.

METAL MARKET.

NEW YORK, July 11, 1902.

Pig Tin.—The market for Pig Tin has stiffened up materially during the week under review, following a sharp advance in London. The volume of transactions, however, was very light and the market closed dull but firm. Jobbers quote Straits Pig in small lots at 29 $\frac{1}{2}$ c. to 30c. per lb., an advance of about $\frac{3}{4}$ c. over the figures ruling at the date of our last report. It is predicted that the arrivals of Tin this month will be rather light, although about the end of the month, or the beginning of next, four direct steamers from the Straits will be due here, bringing close to 2000 tons.

Copper.—The Copper market has continued extremely dull, although its tone is steadier than it was last week. Prices are still in buyers' favor. Jobbers quote Lake Ingot in small lots at 13c. per lb., and Casting Copper at 12 $\frac{1}{2}$ c. to 12 $\frac{3}{4}$ c.

Sheet Copper.—The demand for Sheet Copper is of good proportions, and the volume of inquiry indicates a considerable consumption of this material in the coming months. Prices continue firm on the basis of 18c. per lb. for Sheet Copper from store.

Pig Lead.—Nothing beyond a hand to mouth business is being done at present in this metal. The market, however, continues steady and prices remain at the level kept for some time past. American Pig in small lots is quoted at 4.45c. to 4 $\frac{1}{2}$ c. per lb. St. Louis advices indicate a continuance of dull conditions in the market for Pig Lead at that point, with no change in prices.

Spelter.—The firmness in the market for Spelter continues unabated. Spot metal is still very scarce and prices are high, jobbers quoting good Western brands at 5 $\frac{3}{4}$ c. to 6c. per lb. St. Louis advices report a continuance of the activity in the market for Spelter noted last week, with prices mounting to a higher range.

Sheet Zinc.—The demand for Sheet Zinc is of the average proportions, and prices are unchanged at 6 $\frac{3}{4}$ c. per lb. for 600-lb. cask lots, and 7 $\frac{1}{4}$ c. to 7 $\frac{1}{2}$ c. for smaller quantities.

Antimony.—This metal is firm and unchanged. Cookson's is quoted in small lots at 10 $\frac{1}{2}$ c. to 11c. per lb., Hallett's at 8 $\frac{7}{8}$ c. to 9c., and U. S. 8 $\frac{1}{2}$ c. to 8 $\frac{7}{8}$ c.

Nickel.—There is no change in the market for this metal. Small lots are quoted at about 55c. per lb.

Aluminum.—The demand continues active, and prices are without change. Small lots of No. 1 Ingot, guaranteed 99 per cent. pure, are quoted at 37c. per lb., and 100-lb. lots at 35c.

Tin Plates.—The market for Tin Plates is without any change worthy of note. Comparatively little business of any amount is being done in this market. Small retail orders constitute about the only transactions that have been effected. Prices are unchanged, jobbers quoting American Bessemer Coke Plates, IC, 14 x 20, in moderate sized lots, delivered in New York or corresponding points, at about \$4.75 to \$4.90 per box. Cable advices report a further decline of 1 $\frac{1}{2}$ d. in the price of Welsh Plates, which now rule at 13s. 4 $\frac{1}{2}$ d., Swansea.

Sheets.—The Sheet market is quiet, except for the heavier gauges, for which there is a good demand, and on which the mills are still considerably behind in their orders. A number of the Sheet mills have been closed down for repairs and stock taking, and operations at others are being suspended on account of the slight demand. Some buyers are seeking to place orders for long time deliveries, but most of the manufacturers hesitate to accept contracts of this kind, and prefer to do a regular business at the ruling rates. Galvanized Sheets are quite dull, and prices on this line have softened considerably. Jobbers quote No. 27 One Pass Cold Rolled Soft Steel Sheets at 3.75c. to 3.80c., and No. 24 Galvanized at 4c. to 4.20c.

Chicago advices are as follows: Heavy Sheets are still well sustained, but all others continue slow and weak, with liberal discounts allowed, especially on Galvanized Sheets. No. 27 Black Sheets in small lots from store are quotable at 3.45c. to 3.55, while Galvanized Sheets in small lots are held at 4.70c. to 4.75c. for No. 27.

Old Metals.—Demand is light for all kinds of Scrap Metals at the moment, but prices show no quotable change. Dealers are paying about the following rates for moderate sized lots, delivered at New York or corresponding points:

Heavy Copper.....	per lb.	10 c.
Light and Tinned Copper.....	per lb.	9 c.
Heavy Brass.....	per lb.	8 c.
Light Brass.....	per lb.	6 $\frac{1}{2}$ c.
Lead.....	per lb.	3 $\frac{3}{8}$ c.
Tea Lead.....	per lb.	3 c.
Zinc.....	per lb.	3 $\frac{1}{4}$ c.
Pure Aluminum Sheet.....	per lb.	22 c.
Cast Aluminum.....	per lb.	17 c.
No. 1 Pewter.....	per lb.	18 c.
No. 2 Pewter.....	per lb.	9 c.
Tin Plate Scrap, per gross ton.....		to \$5.00
Wrought Iron Scrap, per gross ton.....		\$13.00 to 13.50
Heavy Cast Scrap, per gross ton.....		12.00 to 12.50
Stove Plate Scrap, per gross ton.....		8.50 to 9.00
Burnt Iron, per gross ton.....		7.00 to 7.25

THE PIG IRON MARKET.

NEW YORK.—There has been no material change in the Pig Iron situation. The situation in the Lehigh Valley continues exceedingly unsatisfactory, while better reports come from Virginia. The latest telegrams from Birmingham indicate that the coal miners' strike in that district will be settled. It is difficult to quote American Pig Irons for nearby delivery, and the following figures are nominal: Northern Iron, at tidewater, No. 1 X, \$23.50 to \$25; No. 2 X, \$22.75 to \$23.50; No. 2 Plain, \$22.25 to \$22.50. Tennessee and Alabama brands are quoted as follows: No. 1 Foundry, \$22.50 to \$23.50; No. 2 Foundry, \$21.75 to \$22.50; No. 3 Foundry, \$21.25 to \$21.75.

CHICAGO.—The result of the scarcity of Pig Iron and the lack of Coke has been an advance of \$2 to \$3 per

ton on Southern Iron for delivery during the remainder of the year. For immediate shipment, even higher premiums have been paid. Most consumers of Pig Iron in the West are facing very serious conditions, and in many instances are obliged to pay excessive prices or suspend work. The market is being literally scoured for prompt delivery Iron. Further large sales of Iron for delivery during the first half of next year are reported. Seventeen dollars seems to be the accepted base for No. 2 Southern Foundry at Birmingham, while \$21 is the prevailing price for No. 2 Northern Foundry, Chicago. The market for spot and early delivery Iron is unsettled and prices irregular. The following are the approximate prices current at the close of the week for delivery during the third and fourth quarter of the year:

Lake Superior Charcoal.....	\$25.00 to \$26.00
Local Coke Foundry, No. 1.....	22.00 to 22.50
Local Coke Foundry, No. 2.....	21.00 to 21.50
Local Coke Foundry, No. 3.....	21.00 to 21.50
Local Scotch, No. 1.....	22.50 to 23.00
Ohio Strong Softeners, No. 1.....	24.00 to 25.00
Southern Silvery, according to Silicon.	24.65 to 25.15
Southern Coke, No. 1.....	24.15 to 24.65
Southern Coke, No. 2.....	23.65 to 24.15
Southern Coke, No. 3.....	23.15 to 23.65
Southern Coke, No. 1 Soft.....	24.15 to 24.65
Southern Coke, No. 2 Soft.....	23.65 to 24.15

PHILADELPHIA.—There has been practically nothing done in the Pig Iron market during the past week. The scarcity of metal continues with no indications of improvement in sight. Sellers are virtually sold up for some time ahead and are making no offerings. There is no tendency toward concessions for next year's deliveries, the only guarantee for delivery being a promise to ship as early as possible. A fair average of prices for deliveries in buyers' yards or nearby points would be about as follows for deliveries during the last quarter of the year, July, August and September deliveries being anywhere from \$1 to \$2 higher:

No. 1 X Foundry.....	\$23.50 to \$24.50
No. 2 X Foundry.....	22.75 to 23.50
No. 2 Plain.....	22.25 to 22.50

PITTSBURGH.—The hot weather and short supply of Coke are combining to keep down the output of Pig Iron, and the immediate supply is shorter than ever. Many of the Valley furnaces are not making more than half their usual product, and until the Coke situation improves the present scarcity of metal will continue. There is a good deal of buying of Foundry Iron, and sales are being made for delivery into the first half of next year. No. 2 Foundry is quoted at \$21.50 to \$22. Pittsburgh.

CINCINNATI.—The general situation in the Pig Iron market shows no material change this week, except that there is a better understanding about prices for Southern brands. The amount of Foundry Iron for next year's delivery continues to be very small. Some sellers hold to the idea that Iron is worth up to \$20. Birmingham basis for No. 2 Foundry, and others say they have been selling in a small way at \$19 for this year's delivery. One large Southern industry continues to sell freely for next year on the basis of \$16.50, Birmingham, for No. 2, but others are holding to \$17. We quote, f.o.b. Cincinnati for 1902 delivery as follows:

Southern Coke, No. 1.....	\$21.25 to \$22.25
Southern Coke, No. 2.....	20.75 to 21.75
Southern Coke, No. 3.....	20.25 to 21.25
Southern Coke, No. 4.....	19.75 to 20.75
Southern Coke, No. 1 Soft.....	21.25 to 22.25
Southern Coke, No. 2 Soft.....	20.75 to 21.75
Ohio Silvery, No. 1.....	24.60 to 25.10
Ohio Silvery, No. 2.....	24.10 to 24.60
Lake Superior Coke, No. 1.....	25.10 to 25.60
Lake Superior Coke, No. 2.....	24.60 to 25.10
Lake Superior Coke, No. 3.....	24.10 to 24.60

St. Louis.—The market conditions differ very little from those given in our last report. The volume of demand and inquiry continues light. The continued scarcity of offerings has resulted in a higher range of values, and the matter of prices depends largely upon the urgency of the demands of the buyer. It is said that a number of concerns using Iron and having more than enough on hand for immediate needs have turned sellers, taking advantage of the present high range of prices. This accounts to some extent for some remarkably high figures. The following is the range of prices current for cash, f.o.b. St. Louis:

Southern, No. 1 Foundry.....	\$21.50 to \$23.50
Southern, No. 2 Foundry.....	20.75 to 22.75
Southern, No. 3 Foundry.....	20.25 to 22.25

Southern, No. 4 Foundry.....	to 19.00
No. 1 Soft.....	21.25 to 23.25
No. 2 Soft.....	20.75 to 22.75

CHICAGO REPORT.

Scrap Iron and Steel.—The offerings of Country Scrap are only moderate and with a fair outlet, notwithstanding most of the mills in this section are still closed for repairs. The market remains firm. Dealers buy offerings in carload lots, Chicago delivery, as follows:

	Per net ton.
Country Wrought Scrap.....	\$14.00 to \$14.50
Machinery Cast.....	to 13.50
Malleable Cast.....	12.00 to 13.00
Stove Plate (free from burnt).....	to 9.50
Burnt Iron and Grate Bars.....	8.00 to 9.00
Sheet Iron and Hoops.....	8.00 to 9.00
Plow Steel.....	12.00 to 13.00
Breaking Stock.....	to 11.00
Old Boilers—whole (Iron).....	9.50 to 10.00
Old Boilers (Iron) cut in single Sheets and Rings.....	12.00 to 12.50
Old Gas Pipes and Boiler Tubes.....	12.00 to 12.50
Cast Borings.....	8.50 to 9.00
Turnings.....	12.00 to 12.50
Horseshoes.....	14.00 to 14.50

Old Metals.—The market for Copper and Brass has continued slow and easy, with Red and Light Brass a little lower, but other kinds are well sustained. The demand is only moderate. Zinc has remained firm with an improved demand. The following prices are being paid by dealers in this market:

	Per lb.
Copper Wire and Heavy.....	10 $\frac{3}{4}$ c.
Copper Bottoms.....	9 $\frac{3}{4}$ c.
Copper Clips.....	10 $\frac{1}{2}$ c.
Red Brass.....	10 $\frac{1}{4}$ c.
Yellow Brass.....	8 $\frac{1}{4}$ c.
Red Brass Borings.....	9 $\frac{3}{4}$ c.
Yellow Brass Borings.....	7 $\frac{1}{2}$ c.
Light Brass.....	6 to 6 $\frac{1}{2}$ c.
Pipe Lead.....	3.70c.
Tea Lead.....	3.35c.
Zinc.....	3 $\frac{1}{4}$ c.
Tin Foil.....	21 c.
Pewter, No. 1.....	18 c.
Pewter, No. 2.....	11 c.
Aluminum.....	20 c.

Old Rubber.—There has been a steady market, with moderate offerings and a fair outlet except for Outside Bicycle Tubing, for which dealers have reduced quotations. The following are the prices paid by dealers in this market:

	Per net ton.	Per lb.
Garden Hose.....	\$25.00
Air Brake Hose.....	45.00
Rubber Shoes.....	7 c.
Rubber Car Springs.....	5 c.
Inside Bicycle Tubing.....	22 c.
Outside Tubing.....	5 $\frac{3}{4}$ c.
Black Rubber.....	4 c.
White Rubber.....	8 $\frac{1}{2}$ c.

Rags.—The offerings have continued quite free, and dealers have been slow buyers, yet prices are without essential change. Dealers buy desirable offerings at 65c. to 75c. per 100 lbs., Chicago delivery.

Anthracite Coal.—The market has been quiet, the new demand showing but little, if any, improvement while stocks have been ample. There has been a fair movement on contracts. The following are the prices current, subject to a discount of 20c. per ton for shipments made during the month of July:

	Grate.	Egg and Stove.
Chicago.....	\$5.75	\$6.00
Milwaukee, Wis.....	5.75	6.00
St. Louis.....	6.20	6.45
Kansas City, Mo.....	8.25	8.50

"PUMP PROFIT" is the title of an attractive booklet, the latest publication of the Berger Mfg. Company, Canton, Ohio, issued in the interest of their Twentieth Century Corrugated Galvanized Steel Pumps. The little work is printed and illustrated in red and black, and contains, in crisp sentences, points of information regarding the construction, merits and uses of these up to date substitutes for the old fashioned wooden Pump.

United States Consul S. S. Lyon of Hiogo, Japan, reports that 18 spacious buildings are being erected for the International Exposition to be held at Osaka from March to July, 1903. They are being constructed of wood and covered with galvanized sheets. At the northern entrance will stand a tower 90 feet high and provided with an elevator. From this tower visitors will have an excellent view of the surrounding country.

THE HARDWARE TRADE.

Manufacturers and the jobbing trade agree in reporting a very satisfactory condition of things. The results of the business of the past six months are such as to encourage them in an enterprising prosecution of their interests, with, in many cases, increased facilities for the making and selling of goods. Much attention, as usual at this time, is being given to completing arrangements for the fall campaign, including such matters as the overhauling of plants, revising quotations, instructing travelers, general consideration of business methods and in various ways maturing plans for an active season. The vacation period and the effect of the summer months naturally interfere a good deal with the activities of the trade, and the lull in the receipt of orders is not unwelcome. Manufacturers are looking for an opportunity to replenish their depleted stocks, but the indications point to an entrance on the fall business with a materially smaller supply of goods than for many years. The jobbers have for the most part covered their requirements for several months to come, and their orders are accordingly comparatively light, but still aggregate a very respectable amount. It is not found a difficult thing to sell goods in the present state of the market, and manufacturers do not find it necessary to make special efforts in this direction. The trade are, with few exceptions, buying freely to cover their needs for the fall, but while there is a hopeful and even sanguine feeling that business is to continue in large volume, there is a conservatism as to placing orders beyond what the trade is pretty sure to readily absorb. With a strong and confident market there is recognition by prudent and farseeing merchants and manufacturers that prices are abnormally high, and that when a reaction comes there must be a material shrinkage in values. In this way the market is restrained from an abnormal activity which might have injurious effects, and the caution thus exercised will doubtless have its influence in tending to postpone the time when the supply will exceed the demand and the effect of competition with greatly increased manufacturing facilities will subject the market to the test under which it is assumed that, in accordance with the laws of trade, it must give way. While opinions differ as to when this will happen there is a pretty general agreement in anticipating a continuation of existing favorable conditions during at least the fall trade.

NOTES ON PRICES.

Plumbers' Supplies.—Local trade in the plumbing line is still rather quiet, but out of town business keeps up in good volume. Prices of Plumbing Goods in practically all lines are strong, especially in Iron Goods, where an advancing tendency is apparent, due to the extremely high prices ruling in the market for the raw material.

Wrought Iron Pipe.—One of the features of the Wrought Iron Pipe market at the present time is the fact that all of the large mills have so oversold their capacity that the jobbing trade is not able to obtain the Pipe due to them. It is said that the mills are asking a premium on the present quotations for prompt shipments. This state of things is creating considerable friction and has caused annoyance to the jobbing as well as to the retail trade owing to the fact that the jobbers have oversold their capacity to deliver and are now compelled to employ all imaginable expedients in order to live up to their obligations. One of the largest jobbing houses in New York was in the market this week for a large quantity of Pipe for prompt shipment, and the only mill that could fill the order, which consisted chiefly of small sizes, named six weeks as its earliest shipping date. This delivery precluded the placing of the order for mill shipment and the jobber was compelled to purchase the Pipe in the local market. The question of a change of price is said to hinge upon the development of an enterprise which is being promoted by the officers of the leading Pipe interest. It was said the early part of the week that this enterprise had fallen through, but a report comes from authori-

tative sources to the effect that options have been extended, and that there is a good prospect of the consolidation being consummated.

Egg Openers.—The prices to the trade on Hartigan's Patent Egg Opener, made by Wm. R. Hartigan, Collinsville, Conn., are \$2 per dozen for the nickel plated, and \$4 per dozen for the silver plated.

Wire Nails.—The output of Wire Nails has been reduced by the shutting down of many of the mills for the annual repairs and clean up. Jobbers' stocks generally are light, and some complaint is heard of delay in getting shipments from mills. The local demand from store has been light, owing to holiday interruptions. Small lots of Wire Nails from store continue at \$2.30 per keg, New York.

Cut Nails.—The demand for Cut Nails in the New York market is light. Prices are unchanged, small lots from store being quoted at \$2.30 per keg.

Window Glass.—The demand in the East for Glass is small, while in the West it is much larger. The Jobbers' Association quotations for Single and Double Strength Glass continue at 88 and 5 per cent. discount for lots from store. A meeting of the Window Glass manufacturers is being held in Cleveland, Ohio, and an advance in prices is regarded as likely.

White Lead.—The demand for White Lead in Oil is not so large as in June, but a fair quantity is being consumed. Prices are without change, small lots of White Lead in Oil from store being quoted at 6½ to 6¾ cents per pound.

Spirits Turpentine.—The Turpentine market has declined during the week under review, which has had the effect of stimulating buying. A strong market, however, is reported at Savannah, which may cause an advance in local prices again. Jobbers' prices for small lots of Turpentine are 48 to 48½ cents per gallon.

Linseed Oil.—The demand for Linseed Oil is of good proportions, and prices are higher. City Raw, in small lots, is quoted at 68 to 68½ cents per gallon.

Rules for Electrical Wiring.

In discussing the question of safe rules in wiring for electrical work a writer in a recent issue of *Electricity* presents the following:

A workman should thoroughly familiarize himself with the rules and requirements of the National Board of Fire Underwriters before attempting to do any electrical construction. The rules are all based on good engineering practice, and are a necessity for the prevention of unreliable and dangerous work. A few of the more important suggestions given in the code and applicable to all electric light, heat or power construction are as follows:

In all electric work, conductors, however well insulated, should be treated as bare, to the end that under no conditions, existing or likely to exist, can a grounding or short circuit occur; and so that all leakage from conductor to conductor, or between conductor and ground, may be reduced to the minimum.

In all wiring special attention must be paid to the mechanical execution of the work. Careful and neat running, connecting, soldering, taping of conductors and securing and attaching of fittings, are specially conducive to security and efficiency, and will be strongly insisted upon.

Wires must not be of smaller size than No. 14 B. & S., except when used for wiring fixtures or by special permission. Wires must be separated from contact with walls, floors, timbers, or partitions through which they may pass by noncombustible, nonabsorptive insulating tubes, such as glass or porcelain. Bushings must be long enough to bush the entire length of the hole in one continuous piece.

Transformers must not be placed inside of any building, excepting central stations, unless by special permission of the inspection department having jurisdiction. They must not be attached to the outside walls of buildings, unless separated therefrom by substantial supports.

Switches must be placed on all service wires, either overhead or underground, in a readily accessible place, as nearly as possible to the point where the wires enter the building, and arranged to cut off the entire current. Knife switches must be so placed that gravity will tend to open rather than close the switch. They must not be single pole, except where the circuits which they control supply not more than six 16 candle power lamps, or their equivalent.

Automatic fuse cut outs must be placed on all service wires, either overhead or underground, as nearly as possible to the point where they enter the building and inside the walls, and arranged to cut off the entire current from the building. They must be placed at every point throughout a system, where a change is made in the size of wire (unless the cut out in the larger wire will protect the smaller). All cut outs must be in plain sight, or inclosed in an approved box, and readily accessible. They must not be placed in the canopies or shells of fixtures.

Circuits or groups of incandescent lamps requiring more than 660 watts must not be dependent on one cut out. Special permission may be secured for departure from this rule in case of large chandeliers, stage borders and illuminated signs.

The following is a table showing the safe carrying capacity of conductors of different sizes in B. & S. gauge as given in the rules:

B. & S. gauge.	Rubber covered wires. Amperes.	Weather proof wires. Amperes.	Circular Mils.
18	3	5	1,624
16	6	8	2,583
14	12	16	4,107
12	17	23	6,530
10	24	32	10,380
8	33	46	16,510
6	46	65	26,250
5	54	77	33,100
4	65	92	41,740
3	76	110	52,630
2	90	131	66,370
1	107	156	83,690
0	127	185	105,500
00	150	220	133,100
000	177	262	167,800
0000	210	312	211,600

No fuse must have a rated capacity exceeding the allowable carrying capacity of the wire it protects.

In open work wiring supports must be placed at no greater distance than 4½ feet apart.

The Tin Plate Wage Scale.

No agreement was arrived at by the representatives of the American Tin Plate Company and the Amalgamated Association, who met in New York last week for the purpose of considering the foot notes included in the wage scale for 1902-1903. The Amalgamated men wanted time to consider the scale offered by the company and suggested an adjournment. The conference will be resumed at a later date, which has not yet been decided. In the meantime the men will continue at work, in compliance with their agreement of last April, which provides that in case of the failure of immediate decision regarding the 1902-1903 schedule they continue at work for the balance of 1902. The new scale, if agreed upon, will, however, take effect beginning July 1 of this year. The American tin plate officials present were: Warner Leeds, first vice-president, and District Managers J. R. Phillips, William Banfield, Cecil A. Robinson and Berthold Goldsmith. The base of the scale has already been fixed and the present controversy is only regarding the foot notes as printed in *The Metal Worker* under the date of June 28.

Considering that only about 15 per cent. of skilled mechanics, according to the statistics, really belong to labor unions, the friends of liberty and equality, says an exchange, will not be sorry to hear that Corporation Consul Rives, in New York, has given his opinion that city authorities cannot legally provide in contracts that only members of unions shall be employed on the work contemplated by the contract, for the reason that such a stipulation establishes an illegal and unconstitutional

discrimination between different classes of citizens, at the same time that, by excluding from city contracts all but certain privileged persons, it prevents competition among contractors.

The directorate of the Louisiana Purchase Exposition, to be held in St. Louis in 1904, being desirous of obtaining an emblem expressive of the importance of the event, have issued an invitation to artists to submit designs either in relief or in color, the final decision to be rendered by a jury, consisting of two painters, two sculptors, two architects and a historian. A prize of \$2000 is offered for the best design submitted. The competition is open until November of the present year, and full information is obtainable from Walter B. Stevens, secretary, Louisiana Purchase Exposition, St. Louis, Mo.

Galvanizing and Tinning.

A Practical Treatise on Coating with Tin and Zinc, with a Special Chapter on Tinning Gray Iron Castings. By W. T. Flanders. Size 5½ x 8 inches. 93 pages, 40 illustrations. Cloth bound. Price \$2.00.

The author of this work has made a specialty of galvanizing and tinning, and has been employed to erect plants in various parts of the country, also to instruct the owners, so that, in all instances, they have been able to operate them successfully. The subject of galvanizing is, therefore, treated from the standpoint of an expert and in a practical manner. The selection of materials and apparatus for erecting plants of large and small capacity is treated, together with instructions for their equipment and accompanied by many illustrations of the plants and of the tools and appliances. Plain directions are given for the preparatory treatment of metals and articles to be coated, and every detail which is of importance in successfully applying to metals a secure and attractive coating is described. The tinning of articles is treated in the same practical manner. The difficulties found by many who have attempted to tin malleable and gray iron castings are explained and methods for doing the work made simple.

CONTENTS.**Galvanizing.**

Locating a Plant and Selecting a Kettle.
The Galvanizing Room.
Tanks for Acids and Other Purposes.
Tools for Galvanizing.
Filling and Firing a New Kettle.
The Use of a Pyrometer.
Materials Used in Galvanizing.
Building and Setting Kettles.
Removing Scale with Sulphuric Acid.
Cleaning Sandy Castings with Sulphuric Acid.
Preparing the Work for Dipping in the Zincing Bath.
Drying the Work.
The Heat of Zinc.
Dipping the Work in the Molten Metal.
The Formation of Dross in the Kettle.
Running Over, or "Sweating," Zinc Dross.

Tinning Malleable Iron, Wrought Iron and Steel.

Preparing the Work.
Tools and Kettles.
A Tinning Plant.
Plan of Tinning Plant.
Removing Scale and Rust with Sulphuric Acid.
Cleaning Sandy Castings by Sulphuric Acid.
Cleaning Sandy Castings with Hydrofluoric Acid.
Removing Paint or Grease.
Tinning with a Single Kettle of Tin.
Tinning with Two or More Kettles of Tin.
Passing the Work Through the Tinning Kettles.
Tinning Wire in Coils.
Tinning Steel Spoons and Similar Articles.
Retinning.
Setting Retinning Kettles.

TINNING COMMON GRAY IRON.

Description of Tinning Plant.
General Considerations.
Tumbling Barrel.
Freeing Gray Iron Castings from Sand by Hydrofluoric Acid.
Cleaning Sandy Castings with Sulphuric Acid.
The Use of a Hot Alkali Bath in Certain Cases.
Preparing the Castings in the Gas Barrel.
Coating the Castings with Tin.

Sent postpaid on receipt of price, \$2.

DOES IT PAY

to use coated sheets in place of black? It does if you use the ALUMINUM COATED. Some of our customers are using it as a substitute for copper. It can be soldered with common solder.

STEEL & IRON ALUMINUM COATING CO.,
CONNELLSVILLE, PA.

Trite but True—"The Proof of the Pudding is in the Eating."

Thus the proof of the Ventilator is in the Ventilating. It is not a matter of theory, but has been demonstrated by actual practice, that the exhaust capacity of the "Anchor" far exceeds that of any other Ventilator; that it is the only known sure cure for smoky chimneys. Uncle Sam is a very particular buyer—witness the Anchor Ventilators in use on so many of his buildings.

Made in Galvanized Iron and Copper with Metal or Glass Top.

The Finishing Touch

to a building estimate is to specify M F Roofing Tin. It is the best roofing material—perhaps just a little more costly at first; but it will last more than half a century; will not rust, or leak. It is the world's standard for roofing tin.

M F
Roofing Tin

is made by the old-style hand process. It carries the heaviest coating of pure tin and new lead. Every sheet is carefully inspected and only perfect plates sold. This **MF** mark stamped on every sheet. Ask your roofer, or

BERGER'S
METAL CEILINGS

Metal Ceilings.

or the one with the common, inartistic kind? In the race for business the dealer with the wrong line is hauling too heavy a load. The Berger line would help him to be a winner; to get more business and with less effort; to please his customers better and more easily hold their trade. Why? Because the Berger designs are greater in variety than others; deeper stamped and more artistic and have constructional features that simplify their erection and reduce the number of joints. Don't be handicapped by a poor line of Metal Ceilings—get in the race—write us at once for details.

JANNEY, STEINMETZ & CO., Drexel Bldg Philadelphia.

The New Metal Worker Pattern Book.

425 Pages. 744 Illustrations.
Size 10 x 13 Inches.

A new treatise on pattern cutting as applied to all branches of sheet metal work.

Cloth Bound, Price \$5.

This work contains a collection of **218** problems and an elaborate explanation of the principles of pattern cutting, including Triangulation.

It embodies the problems of the former Metal Worker Pattern Book, all of which have been revised, and many of which have been entirely rewritten and solved by more approved methods. To these have been added **75** new problems and much other new material and explanatory matter, making this work a model of completeness in every respect.

ARRANGEMENT.

In point of arrangement the new work far surpasses the former one in that the problems are classified under three different heads, and simply indexed, and also that by means of a table of contents any required department of the work can be easily found.

CONTENTS.

While Chapter VI, comprising the greater part of the work, is devoted to the solution of problems, the five preceding chapters thoroughly explain the principles of pattern cutting, and place the student in possession of the preliminary information necessary to a thorough understanding of the subject.

SUMMARY OF CONTENTS.

- I. Terms and Definitions—15 pages.
- II. Drawing Instruments and Materials—13 pages.
- III. Linear Drawing—6 pages.
- IV. Geometrical Problems—35 pages.
- V. PRINCIPLES OF PATTERN CUTTING—25 pages.
- VI. PATTERN PROBLEMS (3 Sections)—325 pages.
 1. MITER CUTTING,
 2. FLARING WORK,
 3. TRIANGULATION.

All Tanners, Cornice Makers and Sheet Metal Workers should be provided with a copy of

CORNICE MAKERS' SQUARING SHEARS.
With Lever Arc, Automatic Gauge. Will cut No. 2 iron,
97 inches long.

HERCULES SHEARS

make the cutting of sheet metal of heavy gauges an easy task for the mechanic and a profitable operation for the employer. With them a man can cut No. 12 steel with one hand on the lever, leaving the other hand free to guide the stock while cutting elbows, ties and circles, as small as 8 inch radius; this is done without burring or buckling either piece, thus avoiding hammering and straightening, which add to the cost of the product. They split sheets of any width or length up to No. 12 gauge, cut wire or bar-steel $\frac{1}{8}$ inch thick, cut off and mitre angle iron $\frac{1}{8}$ inch thick, and do it perfectly.

The Coal Strike!

Does it affect your customers? Even if the strike were settled to-day, coal will be high in price this winter. You will have some furnaces to buy this fall. How important for both you and your customer that the Paragon Furnace should be installed, which deals so gently with that little pile of real Klondike coal. And then there is no waste to the fuel the Paragon does use. Clean, perfect combustion is possible only in the Paragon.

ROUND OAK

Standard of America

The Genuine Round Oak Heating Stove cannot be worn out even in twenty years if bought large enough to heat the space desired without forcing

Sometimes people buy a small Round Oak to heat a large space and melt it down Of course, that's not the fault of the stove and we cannot help it but even these instances are few

The Round Oak even in small sizes will stand a lot of abuse before it gives up

Inquiries from unoccupied territory for the sale of this famous stove solicited

PORTSMOUTH, O.

The Busiest Makers of Stoves and Ranges in the World.

QUICK MEAL

ENAMELED STEEL RANGES

Are made to meet the demand for a High Grade and High Finish Steel Range. Their walls are triple lined and extra heavy. The Oven Plates are well braced and are formed up in such a shape as to prevent warping.

The Nickel Ornaments and outside trimmings are neat and well proportioned, while the enamel on the walls is baked on, giving the Range a handsome and smooth finish. Wherever the wall is exposed to intense heat the enamel is protected with extra asbestos, or a piece of sheet steel of the same finish, with air passing between it and the body of the Range.

A 62-PAGE PAMPHLET

Comprising a Series of Articles and Letters on *Chimney Troubles and Their Remedies* published under the title

Contains a compilation from the columns of THE METAL WORKER, of articles and correspondence relating to house chimneys, defective flues, and kindred topics, comprising a source of information of the most practical and reliable nature, on overcoming difficulties which occur in the working of chimneys, flues, etc.

To all who are interested in flues and drafts, in their relation to stoves, furnaces and house heating apparatus, this book will prove instructive and helpful.

The Contents are as follows

POINTS ON CHIMNEYS . . . 7-32

An illustrated article by J. L. Bixby, Jr., describing many details in chimneys, which cause trouble, and giving remedies. An important table is presented, of the sizes of chimneys required in dwelling houses, based upon the amount of work to be done.

DEFECTIVE FLUES . . . 33-35

This article presents information resulting from a wide, practical experience of the writer, and gives sound advice on some of the details of chimney construction.

HOW TO IMPROVE A WEAK CHIMNEY . . . 36-40

VARIOUS FORMS OF VENTILATORS or CHIMNEY TOPS 41-45

CONDENSATION IN STOVE PIPES . . . 46, 47

DOWN-DRAFT

Oak Stove

A Fuel Saver.

Burns one-half less than other Hot Blast Stoves.

FIRE POT at top of stove. Smoke pipe at base. Heat drawn to the floor. Fresh fuel being placed on top of fire, all gas and smoke are drawn through the fire to the base of the stove and consumed. Burns any kind of fuel and holds fire over night.

Has large ash drawer, which does away with dust and dirt in removing ashes.

Most economical stove on the market, as it utilizes more of the fuel than any other.

"SKIN" FURNACES

and "skin" furnace work are things of the past. Dealers who have done this kind of work have found it unprofitable, because cheap furnaces, cheap material and cheap work made heating impossible and alterations cut deeply into

"SKIN" PRICES.

The reputation of the furnaces used in such work was ruined, as well as the dealers', and the loss of business and loss of credit have compelled most of such dealers to go out of business.

IN THE present time when money is plentiful the furnace dealer can increase his business and improve his reputation by selling a good furnace, using good material installed in a proper manner.

THERE are plenty of good furnaces on the market, and among them can be numbered the

Rival Furnace

illustrated herewith. It is made from the best brands of pig iron, no scrap being used in its construction. It is made by skillful workmen, and its construction secures efficiency, durability and economy.

MANY first-class dealers have handled this furnace for years and want nothing better. Other dealers do not know about it, and we would like to hear from such dealers, and will send them without charge our Furnace Catalogue, which not only illustrates and describes our line of furnaces, but contains valuable information.

WRITE
US
NOW.

We have hundreds of agents handling our furnaces, but we want hundreds more, and want one in every city and town in the United States where our furnaces are not now represented.

We give exclusive sale, and the dealer who sells our furnaces gets the best business in his town.

GIBLIN & CO., Utica, N. Y.

No orders too large for our capacity, none too small for our best attention.

When in the market for Boilers, Furnaces or Ranges for house heating purposes, write to

The **BOYNTON FURNACE CO.,**

CHICAGO.

NEW YORK.

IF YOU ARE NOT SELLING THE

Peck-Williamson Underfeed Furnace

you have not the trade and are not making the money you might. Just a pull or two of the lever feeds the new coal from underneath.

The Underfeed Furnace consumes less fuel than any other furnace ever built. The coal is burnt more slowly. All the heat units from it, as well as from the smoke, are utilized and all smoke eliminated.

Our handsome booklet explains its splendid heating qualities and coal saving.

You may have this booklet and our special plans for selling. Ask for booklet about our Laundry Dryer also.

THE PECK-WILLIAMSON COMPANY,
CINCINNATI, OHIO.

Front Rank **Hot Air Furnaces**

are built on vertical lines; air comes in direct contact with entire heating surface.

The Front Rank Fire Chamber is one solid sheet of closely riveted steel; being lined above the fire lines with genuine fire clay tiling it is the most durable made.

The radiators are very large and have an unusual area of heating surface in comparison with the size of fire pot.

These furnaces burn hard or soft coal or coke. We also make wood burning furnaces.

Send for our catalogue, it will give you a better idea of what we make.

The New WALKER BOILER for Steam:for Water

A boiler to keep fire with little attention, to easily work up to its full rated capacities, and a margin to spare for emergencies—that's our boiler. The price may be lower than you are paying for boilers of equal size. Our Walker Boilers have triangular grates, deep fire boxes, push nipple joints, and easily cleaned flues, construction is first-class, and castings of superior quality.

SOLD ON HONEST RATING PLAN.

Will be pleased to send catalogue and discounts. Correspondence and inspection invited.

310	31 "	62 "	52 "	135 00	17 00	7 50

The "DIGHTON OAK" is made especially for burning wood, but is as well suited for coal, coke or gas for fuel.

The general type of construction is exactly the same as the regular "DIGHTON," which has become so well-known as a durable and economical heater. The outside measurements, flue construction and flue measurements are the same; the large double feed doors allow of taking in large chunks of wood or a 4-foot stick cut once.

The wood grate is not fastened to the fire pot or coal grates; it rests upon the triangular grate bars, and by easily turning these bars the circular flanges on the under side come in contact with them just enough to thoroughly clean the fire. If at any time it may be desirable to use coal instead of wood as fuel, this grate can be removed in a minute's time through the feed door and set aside until such time as you wish to change to burning wood again.

I can hold my hand over my chimney. No waste heat. I use a Rochester Radiator and save half the fuel.

THIS shows the construction of the ROCHESTER (stove-pipe) RADIATOR.

THIS has been advertised extensively for years.

THIS is the one your customers have frequently asked you about.

THIS is built like a steam boiler.

THIS has 9/10 of its radiating surface directly over the hot current, where every square inch of surface is as effective as six at the side.

THIS gives the results that have so surprised those who have used them and induced our patrons to do so much missionary work for us. Your patrons will gladly do it for you, if you give them the opportunity. Get a few started and after that they will almost sell themselves.

Why Sell "THATCHER" Furnaces?

Third Reason:

BECAUSE THEY SAVE COAL

"Unless you run a coal yard you will find the ordinary coal eating furnace is hard to sell. 'How much does it cost to run?' is a very early and proper question. You can always meet that question squarely with THATCHER. Thousands of successfully heated homes attest their economy in operation."

The Climax RATCHET STOCK

Is an indispensable tool for conveniently threading iron pipe in ditches, under floors, in corners, over head, etc. With this tool threads can be cut without removing whole lengths of pipe. This tool is provided with a strong vise which securely grips the pipe and by means of the leading thread the die is forced on pipe and the thread is cut. It is made of malleable iron and steel, and while light in weight, making it convenient to carry, is very strong and rigid. The advantages of this tool make it absolutely indispensable to Plumbers, Steam and Gas Pipe Fitters, Gas and Water Companies, Machinists, etc. It takes standard size dies, which are extra if furnished.

No. 1 threads $\frac{1}{4}$ to 1 in. pipe, takes 2 or $2\frac{1}{4}$ in. die, \$10.00.
No. 2 threads 1 to 2 in. pipe, takes $2\frac{1}{2}$, 3 and 4 in. die, \$17.00.

DETROIT, MICHIGAN,

Manufacturers of

Steel Enamel and Steel Glad
BATH TUBS and HEATERS.

COLWELL LEAD CO.,

63 Centre Street, New York.

Manufacturers of

LEAD PIPE, SHEET LEAD, SHOT,

And Sellers of

Everything You Want for Plumbing.

The Kelsey Warm Air Generator.

A HEATING APPARATUS with from nine to seventeen vertical corrugated cast iron flues, or Sections, forming the Fire Cylinder and Combustion Chamber, and having 65 square feet of heating surface to each square foot of grate surface.

Warms thoroughly and to the proper temperature great volumes of air, by passing it through the flues, and conveys it to every part of the building.

Provides heat and most perfect ventilation for Residences, Churches and School Buildings.

Accomplishes results which lead to further sales at satisfactory profits for the dealer.

Send for 164 Page Book of "Opinions." 20,000 in use.

KELSEY HEATING CO., Makers, Syracuse, N. Y.

NEW YORK OFFICE, after May 1st, 156 FIFTH AVENUE. L. V. Sanford, Manager.

COOK & VAN EVERA CO., 38 E. Lake St., Chicago, Western Selling Agents.

Tackle Boxes and Minnow Buckets

Are necessary requisites for a fishing trip. Your customers will call for them soon. We have them in all sizes and styles to supply your wants. Write any of our branch offices for prices and information.

NATIONAL ENAMELING & STAMPING CO.

Correspondents Must Give Their Addresses.

We are always pleased to receive requests for information from our subscribers, and are willing not only to take great pains, but even to incur considerable expense, in preparing the answers to questions of a practical nature which may be referred to us. Not an issue of *The Metal Worker* appears which does not contain a number of answers given to inquiries which have been referred to us by our subscribers. We can, therefore, not be accused of slighting any of these requests which are made. It happens, however, that readers of *The Metal Worker* will occasionally send in a request for information without disclosing their names. It is extremely desirable for us to know who the parties are who send us inquiries. It is not for the purpose of publishing their names, but simply because it may be extremely important at some time for us to know from whom the question came. Sometimes we desire to conduct some additional correspondence with them. It is certainly a small matter for any one to give his name and address when he sends a question to *The Metal Worker* which may require considerable trouble and expense in preparing and publishing the information desired. This matter has recently grown in importance, as the number of unsigned communications we have received has been increasing. The past week, for instance, we have received a communication from Baltimore, asking who manufactures a certain heat governor; another from a town in New York, asking for the address of certain heating and ventilating contractors; another asking how to cut the miter patterns for a roll cap on a pitched roof, and another from Canada, asking a question regarding the amalgamation of certain trade unions. These questions would have received prompt attention if the writers had in each case given their addresses. As each issue of *The Metal Worker* contains a request to correspondents to give their names and addresses, we are obliged to refrain from answering these communications in our columns until the information which we desire is forwarded to us. If any of the writers of the above communications will comply with our very reasonable request, we shall be pleased to give their communications attention.

The Johnstown Mine Calamity.

The loss of life in the coal mine explosion at Johnstown, Pa., which occurred on the 10th inst., proves to have been considerably less than was at first estimated. This is something of a relief, as the earliest reports sent

out were of a character to make the disaster dreadfully reminiscent of the appalling loss of life by the flood of May 31, 1889, when that town was almost destroyed. Nevertheless, this fresh calamity will take rank among the most serious mine disasters, as according to latest advices the number of the dead is known to have been 112, and other victims may be discovered when the workings are completely explored. The cause of the catastrophe is stated to have been an explosion of fire damp in one of the Cambria Steel Company's coal mines, known as the Rolling Mill mine, in which a force of over 700 men were employed, producing about 2500 tons of coal daily. This mine was first opened in 1861 and has since been the best of the company's mines, furnishing much the greater part of their coal supply.

As usual when a disaster of this kind occurs, harsh criticism was immediately leveled at the Cambria Steel Company for not having taken proper precautions for the safety of the miners. It appears, however, that the strictures were not even remotely deserved, as the State mine inspectors have freely discussed the condition of the mine with press representatives, stating that they had always found it among the best over which they had supervision. Intimations are given that at the inquest, which is shortly to be held, the responsibility for the accident will be clearly shown to rest upon one of the miners, who probably violated the regulations adopted for the safety of himself and his fellows and perished as a result of his own carelessness. This contingency is always necessary to be borne in mind in passing judgment relative to a mining accident, especially an explosion of fire damp. The appliances for ventilation may be of the most elaborate character, and every conceivable care may be taken by the owners and engineers of a mine, only to be set at naught by some reckless or thoughtless miner, disposed to take chances of an accident, either to increase his output and his earnings or to avoid inconvenience to himself. It is most deplorable that such a miner cannot perish alone if he willfully violates regulations adopted for his own safety. But he never does. In this case not only were scores of his fellow miners swept out of existence, but heroic superintendents and foremen also lost their lives in endeavoring to rescue those who might be imprisoned in other workings. It will be many long years until the recollection of this great calamity is effaced from the memories of either those who were rescued or those who belong to the bereaved families.

Progress of the Workingman.

The most casual study of the labor question in this country must make it apparent that the status of the American workman has been steadily rising in the past half century and that his progress, in regard both to wages and hours of labor, has been remarkably rapid in the past few years. Fifty years ago a skilled mechanic earned from \$1.25 to \$1.75 a day, and the day's work usually lasted from sunrise to sunset. To-day the same class of workman earns from \$3 to \$4.50 a day and begins and ends his work at a fixed time, which is usually within the limits of eight or nine hours. It is true that the cost of living has materially increased in the

interval, but this increase is certainly not proportionate to the growth in wages. The twentieth century workman lives better, dresses better and has many more comforts and luxuries, with more time to enjoy them, than his predecessor in the middle of the last century. The wants of the workman to-day are certainly greater than they were in the early fifties, but that is because he has risen in the scale of life. Whether, under the strain of modern methods and the limitations of his labor unions, he is happier than the mechanic of fifty years ago is, as Kipling would say, "another story." It is a fact, however, that the workman, as a class, is rapidly nearing his ideal, an eight-hour day—eight hours' work, eight hours' leisure, and eight hours' sleep—with good wages to enable him and his to live comfortably and enjoy the ordinary pleasures of life. This is certainly not an unworthy ideal, and few will grudge the workman its attainment.

A Year's Foreign Commerce.

Considerable interest attaches to the record of the foreign commerce of the United States in the fiscal year just closed. The official figures of the Treasury Department which have been given out from month to month indicated that the year would show a material decline in the value of exports as compared with the fiscal year 1901. The preliminary figures, just published, show a drop of \$105,000,000 in the exports for the twelve months ended June 30, 1902, as compared with the exports for the fiscal year 1901, and a decline of \$12,000,000 as compared with the fiscal year 1900. This decline is attributed almost exclusively to the result of the drought of last year, the greatest reduction in foreign shipments of American products being in the item of corn, which fell from 177,000,000 bushels in the fiscal year 1901 to 27,000,000 bushels in the fiscal year just ended, while oat exports dropped in the same period from 37,000,000 bushels to 9,000,000 bushels. This made a difference of fully \$76,000,000 in the value of our grain exports in the past fiscal year. Moreover, the value of cotton exports declined \$24,000,000 below that of 1901. This, however, was caused entirely by the fall in the average price of that staple, for the quantity of cotton exported in 1902 was actually 160,000,000 pounds greater than in 1901. The third item of reduction in exports was in manufactures of iron and steel. The reason for the falling off in this department was the fact that the domestic demand was so great in the past twelve months that it fully absorbed the production, leaving little or no surplus for exportation. While the exports of 1902 are thus shown to have fallen off materially, the imports for the twelve months were the largest in our history, amounting to no less than \$902,911,308. The nearest approach to this sum was \$854,000,000 in 1891, which was caused by the change in the tariff laws that year. In only three other years have the imports exceeded \$800,000,000—namely, 1893, 1900 and 1901. This increase in importations is regarded as gratifying, in that it demonstrates unusually active conditions in our manufacturing industries, the increase being almost exclusively caused by a remarkable growth in the importations of manufacturers' materials, which also formed a larger percentage than ever before in the grand total of imports.

In the Furnace Market.

The conditions, so far as the cost of pig iron, wages and supplies are concerned, bearing on the product of those foundries which are most interesting to the read-

ers of *The Metal Worker* have been alluded to frequently in our columns within the past few months. In many lines of goods, and particularly in stoves, advances have already been made in all parts of the country. The manufacturers of hot air furnaces, however, have been slower to take the step of advancing their goods as the prevailing conditions would warrant. There is evidence, however, since July has come in, that furnace manufacturers are awakening to the position which they are in. It has been a common opinion that hot air furnaces of all grades have sold at prices that are too low, and that are by no means bringing in a suitable return for the energy expended and the capital invested in their manufacture and sale. Those interested in this branch of trade in the vicinity of New York, without calling a formal meeting, have utilized the lunch hour as casual meetings for the discussion of the advisability of getting more money for their goods. Several houses have independently advanced the price of their product, and a strong probability exists that their example will be quite generally followed before the fall season sets in. There also seems to be evidence of a realization of the fact that far too great a proportion of the cheap form of hot air furnaces is sold, and of the folly of the practice. These cheap furnaces not only bring in very little profit, but have the detrimental effect of supplying the demand, so that the better grades of furnaces, that pay a satisfactory profit, are largely cut off from sale. These cheap furnaces cannot naturally prove very economical or efficient, and they not only fail to stimulate a more general or popular demand for furnace heating, but through their unsatisfactory service they tend to cause buyers to seek some other form of heating apparatus. The sale of cheap furnaces, to the exclusion of a better grade of goods, has prevailed to a large extent in all sections of the country, and it is to be hoped that should the furnace trade generally find it advisable to advance their prices the discussions to that end be accompanied by suggestions for promoting the sale of more of the better class of goods and less of the cheap grades.

Dun's index number of prices of the leading staples, proportioned to consumption, was \$101.910 on July 1, against \$101.168 on June 1, and \$91.509 on July 1, 1901. Although the cost of living is higher now than at almost any earlier date, it shows a moderate decline as compared with the record of \$102.289 on May 1. This decline is attributed mainly to a decline of over 8 per cent. in the price of dairy products and garden truck. The high prices of corn and meats, however, to a large extent counteracted declines in other directions. Breadstuffs rose 6.7 per cent. in price during June, attaining the highest point covered by the record. In miscellaneous food products, outside of those mentioned, there was practically no change in the past month, while the fluctuations in other staples were insignificant. Comparing present prices with those of a year ago, the average advance is placed at 11 per cent., while breadstuffs are 38 per cent. higher, and meats 23 per cent., all of which means a material increase in the cost of living.

It is well known that the demand for cold drinking water is great in office buildings, and especially in those of New York City, where the heat at times during the summer is almost unbearable, owing not alone to the high temperature, but chiefly to the moisture in the atmosphere. In order to supply this demand the proprietors of the Atlantic Building during the summer installed an extensive water cooling plant. The machine is not intended to make ice, but merely to cool the water to about 38 to 40 degrees F. for drinking purposes.

A STOVE CAPTAIN NEEDED.

The following communication from a prominent stove manufacturer will undoubtedly be read with much interest by the trade:

When one who has been in the stove business all his life, knows its possibilities and opportunities and what it has done, reads the statement of President Charles M. Schwab of the United States Steel Corporation and sees that the expected profits for the coming year run up over \$140,000,000, he wonders where the stove business comes in. The stove industry is one of far greater usefulness than the manufacture of steel rails, structural steel and other products made by the United States Steel Corporation, for every family must cook to eat and must eat to live, whereas railroads do not have to be built, neither is it compulsory to erect buildings, or even if a building must be erected it need not be composed of steel frame construction. On the other hand, every wooden or brick house contains one or more of the products of a stove foundry; this, however, is not necessarily the case with the products of the United States Steel Corporation.

The concentrated product of the stove business, if it had a captain with the brains and backbone of Mr. Schwab, would show results which would astonish the old-fashioned stove manufacturer. The stove business is now principally run by the buyer and the Molders' Union. The poor devil of a manufacturer has little to do with it; he is only submitting to what he cannot help. The stove manufacturer does not control his iron, coke or coal, and only incidentally controls his bank account. If the stove business had a captain it would then control its iron, its coke and not only its bank account, but the Molders' Union as well, not to the detriment of any one but for the benefit of all. When nearly every other product made here is exported in large quantities, why cannot stoves be exported? It is true they are exported, but what a penny peanut business it is compared with almost any other line of equal importance.

The stove business needs a captain, and needs one quickly. It needs a captain who will gather the scattered soldiers who are all fighting on their own account, and fighting each other at that, and bring them into a harmonious company and march them on as one man, shoulder to shoulder, to the success that should come to hard and earnest workers. Where can the stove business find such a captain? Does any one know?

ANENT HARD KNOTS IN FURNACE HEATING.

BY O. H. R.

Having read the article entitled, "Some Hard Knots in Furnace Heating," in *The Metal Worker* of February 8, I should like to suggest that while the writer has shown good logic on most of the points he has touched, treating cause and effect from both the scientific and theoretical standpoints, he seems to have lost sight of the law of gravitation. In his illustration the cold air is made to take an upward course of circulation from the cold air face located near a window on the north side of the room at the outside wall, while the warm air register is located on the opposite side, or in the south part of the room. As indicated by the arrow points, the warmer air that should come from that opening may, of its inadequacy, be overcome or held in check, back pressured or air compressed, as he puts it, because of the density of the cold air as a counteracting force. I presume that when he states that the air "ducks heads," he means that it does not return to the furnace through the hot air pipe, but through the failure of a sufficient quantity of hot air to enter the room, and owing to the large amount of cold air in it, the temperature decreases in the room faster than the limited amount of warm air entering, owing to retarded circulation, can overcome. As to the air coming from the cold air exhaust, that would be contrary to the law of gravity. Because of its relative density it must fall. The cold air duct is a part of a positive circulating system, and to prove the point it is only necessary to ob-

serve the numerous cases where the cold air is taken directly from the outside of the building for the purpose of producing the best results.

At this particular writing the sun shines so brightly in favor of recuperative recreation from our many trials with the mass of ungrateful patrons of the furnace business, that it is very difficult to draw one's imagination into actually seeing atoms of hot air and cold air passing along through their respective channels, retracing, being retarded, back pressured, or air compressed, by these counteracting agents or forces of nature, as I understand to have been portrayed by "Old Rosinhead." I hope, however, that the discussion of this class of heating will be of benefit to those who, in the interest of the public at large, and of a more perfect and sanitary system of heating and ventilation, are exhausting every possible means to that end now known to them, and will, as a result of the united effort, supply what has been a long felt want—comfort, satisfaction and pure, warm air.

The Portsmouth Stove & Range Company.

Under the title of Catalogue No. 10 the Portsmouth Stove & Range Company, Portsmouth, Ohio, have issued an interesting publication of 138 pages, relating to their leading lines of steel and cast ranges, cook stoves and heaters. Careful attention has been given to the arrangement of the matter, which is neatly printed on pages with rounded corners and bound in colored paper covers with embossed side title. Among the early pages are to be found directions for setting up and operating stoves issued by the National Association of Stove Manufacturers, together with an illustrated description of some of the special features and advantages of a Model steel range over a cast range or a cook stove. This constitutes an interesting chapter, as the illustrations relate to the construction in detail of important features embodied in the range in question. The Model is made with either polished steel or japan finish, and is offered in a number of styles and sizes. In the catalogue is shown for the first time the company's new series of four-hole Model ranges, which are in harmony in general style and make-up with the six-hole series. They have the same steel fire box, nickel parts, closets, shelves and balanced oven door, but no pedal attachment for opening it. The new four-hole range is said to be particularly adapted for city use where floor space is usually at a premium.

Following the Model steel range, attention is given to a varied assortment of cast goods, including the Ideal, Regal, Perfect and Superb Queen ranges, adapted for using coal or wood as a fuel. The exterior is cleverly treated with cast ornamentation in combination with nickel parts, while the constructive features are of a modern type. Another style of decoration is used on the Northern and Southern Queen, Welcome, Domestic and Queen cook stoves. These, in turn, are followed by the Western Queen square oven ranges and stoves, which are of the same general style as the Ideal, but there is a difference in the construction of the fire box, which is made especially for burning wood. Various other lines of cooks are also illustrated.

Among the heating stoves, the leading place is given to the Model radiator for hard or soft coal. This is made both as a single or double heater and embodies features of construction which the company feel cannot fail to command the attention of the trade. The new Model oak is another handsome parlor heater, made in four sizes, and thoroughly up to date in all respects. A miscellaneous assortment of Franklin, cottage parlor, sheet iron surface burners, laundry, box and cannon stoves occupy the concluding pages of the catalogue, together with a description of the Mogul furnace and price-lists of jamb grates, hollow ware, sugar kettles, &c. A feature, which is now to be found in connection with stove catalogues of the leading manufacturers, is skeleton cuts of stoves showing the various parts numbered and referring to explanatory tables, with a view to facilitating the ordering of repairs by dealers and avoiding the annoying mistakes which are constantly arising in this branch of the business.

FOUNDRY COSTS.*

BY R. C. CUNNINGHAM, HOLYOKE, MASS.

At the last annual meeting of this association I presented a paper on "Foundry Costs." The ground I took at that time was that we were doing a large amount of work in our foundries which only increased our costs and did not increase our production, this unnecessary work being due to badly made and worn out patterns. The article was severely criticised by pattern makers and others in trade journals and by personal letters. One man went so far as to say that the principal reason that foundrymen were not consulted more in the construction of patterns was that very few could tell by looking at a drawing how a pattern should be made, and during his 25 years' experience as a pattern maker he had only met one foundryman who could read drawings intelligently. It was claimed that the paper had a tendency to create a bad feeling between foundrymen and pattern makers, and there would be constant wrangling as to how patterns should be made. I certainly had no intention of saying anything to belittle the pattern maker or to provoke discord in any shop. I made the statement at the time only in the interest of the foundrymen, and I feel to-day that I am backed by a large majority in what I said.

Shortly after the convention I had occasion to visit a prominent concern. In conversation with the manager he told me that he thought my paper would do good, and wanted me to go through his works and tell him just where he could save money. He further added, "I think we are about up to date, but am willing to learn." I went into his foundry, and in observing things my attention was attracted by a molder standing apparently waiting for something. While I was watching him the workman next to him passed him over his rammer. He took it and went to work. Upon investigating I found that these two molders had only one rammer, one shovel and one No. 4 riddle. Neither had a fine riddle, brush, pail or bellows, nor, in fact, any of the tools that are usually furnished by the company. They had quite a number of helpers in the shop. They did not give each of them a shovel. I spent the greater part of a day about the shop carefully observing the way the place was managed, and I think I am safe in saying that 10 per cent. of the men did not have proper tools to work with and depended on borrowing from the other men or upon what they pick up about the shop. As I was leaving, the manager called me into his office and inquired if I saw anything I would have different. I told him I thought there were some things that could be improved upon. He wanted to know what they were. I told him of the things I saw in the shop. He thanked me, and said: "I will look into it and I will write you." This happened about ten months ago. I had forgotten about it when a few weeks ago the following came to me:

You will remember spending a day at our works several months ago and of expressing yourself about how you found things in the foundry. The next day after you were here I went into the foundry to find out the truth of your statement, and I will have to admit you did not half tell it. I went into the foundry and stayed there over a week, and I will say candidly I do not see how the men could do as much work as they did. In a few days every man had his supply of tools, marked with his number. I stopped the molders waiting around in the morning. I had all their patterns and flasks on their floors by 7 o'clock. I have the flasks fitted before the job comes into the foundry. The molders work no harder than they did before, but we are turning out more castings and they are much better. Our expenses remain about the same, lower if anything, which shows a reduction in the costs. The statements you made in your paper before the American Foundrymen's Association last year were facts. Our foundries are neglected. We should pay the same attention to them that we do to our machine shops. I sincerely hope you will give us another paper on the same subject this year.

This letter comes from a man who thought his foundry was up to date, and I have no doubt that there are many more of the same mind. Now I wish that every foundryman present at this convention, when he returns to his own home, would go into the foundry and do as this man did, stay there a week or a month if necessary (It is a good healthy place to stay) and just take notice

of the patterns that come into the shop and see if the molders have the proper rigging.

See that there is no waiting for anything. Give your molders a chance and you will be surprised at the results. Now I wish every foundryman present to-day would try this, and at the end of three months write me the results; no matter what they are, I would like to know how you found things in your shops. Those of you who are about your shops daily have no doubt seen and corrected everything of this kind found there, but those of you who walk through your foundry only occasionally are the ones that I want to take this to heart and bear in mind that the little annoyances are where the time is lost. They may seem small in detail, but are large enough in the aggregate to increase the cost of your castings. The time when we can get more than a fair day's work from a man has gone by, and to-day every foundryman must keep close watch on his costs and production or he will find the balance on the wrong side of his ledger. In my opinion his only hope is to devise ways to do his work with more unskilled labor. By doing this he will not be dictated to, but will have a chance to get more benefit of his brain work than is now accorded to the employer of skilled labor.

There is one fact that we must not close our eyes to, and that is that the tendency of organized labor is to keep the production down to the lowest possible point, and at the same time increase the minimum rate of wages. Now with these cold facts staring us in the face we must watch very carefully and see that no work is done that we get no returns for. An hour or two spent on a badly made or worn out pattern means an increase in our cost, and does not increase our production, and in order to overcome this we must figure and scheme to have things so that the molder can turn out more work. An increase in our production without any increase in our cost is what we must aim for. To do this we must study every pattern, and if we can, by making changes, make a mold any quicker, we should not delay a single day in doing so.

I want to give you one illustration on this point: We have at our works a pattern for a 16-inch steam piston ring. During the past 25 years the company has made thousands of these rings. They were molded in the usual way. The pattern was made about 1 inch wider than the casting wanted, to be able to secure it on the face plate while turning. The ring is then cut off the desired width, and cut into four segments. The actual cost of labor on one set of these castings when they were ready to put into the cylinder was 75 cents. The casting in the rough weighed 23 pounds. The finished casting weighed 7½ pounds. The waste piece cut from the ring, that went into the scrap, weighed 6 pounds. Nine pounds went into turnings. I expended \$3.75 on a new pattern and plates, and am now putting these same castings into the erecting room for 4 cents a set. Besides the saving on the iron, I am saving 71 cents on labor on each set of castings. The company make probably 500 set of these rings a year, including the new work and repairs. The saving on this job alone amounts to three hundred and fifty odd dollars. A half dozen jobs like this would pay the salary for a good man for one year.

I do not claim that every job can be put on a machine on plates and the same results obtained, but even if we can get an increase in our production of 25 per cent. without any increase in our expenses, it is certainly worth trying for. Our company have put on plates during the past year over 200 different patterns, and on none of them have we made anything less than 50 per cent. saving. Any foundryman is welcome to come and inspect our patterns. We have no secrets about our shop. What we have learned by experience we are willing you should profit by if you wish.

An amusing incident happened at our works a short time ago. A foundryman was visiting our shop and I was showing him this same pattern which I have mentioned here. After looking it over carefully, he said: "It is a very fine idea, but I fail to see where you get any credit for it. According to your own statement you have cut down your production about two-thirds. Now, unless your firm do differently from any other you

* Paper read at the meeting of the American Foundrymen's Association, Boston, June, 1902.

only get credit for what castings you turn out; where you formerly got credit for 23 pounds of castings, now you only get credit for 7½ pounds. It looks to me as if you were helping the machine shop at the expense of the foundry." I told him I was working for a firm that gave credit where it was due, and I think that every company should let their men understand that any improvements gotten up to reduce the costs or increase the production would be liberally paid for. It should be the aim of every foreman to encourage this among his men, particularly among the younger class. There is nothing that encourages a young man as much as it does to ask his opinion. We must remember that from among the young men we are to find our future foundry managers, and when they take the burden from our shoulders let us have the satisfaction of feeling that we exercised our ability to its fullest extent in filling up those dangerous pitfalls and removing as far as possible the stumbling blocks from their paths.

The Standard Hot Air Furnaces.

Furnacemen will be interested in the publications relating to the Standard furnaces and combination heaters issued by Giblin & Co., Utica, N. Y. One catalogue is devoted to useful information, ratings, and price-lists, while the other shows by means of general and broken views the construction of the various styles of the Standard all cast iron and steel drum furnaces manufactured by the house. Illustrations are also given showing the water heaters made by the concern and their application to the various Standard constructions. One page shows the construction which can be adapted to all of the Standard furnaces for the use of natural gas fuel. Broken views in the back part of the catalogue make the construction of both the Standard steel radiator and the Standard all cast iron radiator, and the travel of the products of combustion through them, readily understood. These heaters are made in a variety of sizes, and in the Rival Junior and Standard furnace apparatus is provided adapted to the requirements of all classes of tradesmen, those who do competitive building work as well as those who confine their efforts to the installation of different forms of hot air furnace heating systems.

The Faultless Ranges.

The Graff Furnace Company, 208 Water street, New York, have just issued a 28-page catalogue in a brown cover, with the name and address of the house on the front in a design in gold bronze. This catalogue is devoted to their Faultless ranges and fire place heaters. At the outset attention is called to the great variety of Faultless and Hero warm air furnaces, steam and hot water boilers, also made by the house. The first place in the catalogue is given to the Faultless brick set double oven range, following which is the Faultless portable double oven range. These ranges are of neat design, provided with a fire chamber of ample capacity, equipped with labor saving grates, sifter grates and ash pans. They have four cooking holes directly over the fire, and the flue construction is such as to maintain an even temperature in both ovens. The Columbia range differs from the Faultless in design and in having but two holes over the fire. These ranges are especially designed for fine residences. The Faultless single oven ranges are made in a variety of styles and sizes, with both right and left hand ovens, and adapted for vertical or horizontal boilers. They are equipped with high shelves, warming closets and sifter grates.

The company have recently brought out a new high gas oven and broiler, applicable to any single oven range. This gas attachment is arranged with a three-burner hot plate, which can be raised up out of the way under the gas oven or dropped down on the top of the range for use, as desired. The Hero is a smaller range, made to meet the requirements of the building trade. The Elegant fire place heater is of the base burner type, having a large illumination and equipped with a labor saving grate. The construction is such that the flues may be cleaned without removing the heater from its

setting. It has a large heating capacity, and is so constructed that the air supply for heating the upper rooms may be either taken from out of doors or from the room in which it is placed. The Ideal Franklin fire place heater is said to embody all the requisites of a satisfactory heater and of an open grate fire, having a large mica illumination and sliding blower doors so that the front can be thrown entirely open or partly open at pleasure. It is made with three styles of frames, either square, circular or of French pattern.

The International Furnaces.

Those interested in furnace heating will derive advantage from securing the latest literature issued by the International Heater Company, Utica, N. Y. New pamphlets recently sent to *The Metal Worker* are devoted to the Wheeler Palace line and the Pease Economy line. The Palace line opens with the Palace Queen hot air furnace, which is of tubular steel construction. This is followed by the Palace King, having a steel radiator of the return flue type, and also a cast iron radiator of the same construction, the cast iron radiator being cast in one piece. The Palace Regent is constructed with a large combustion chamber, the outlet from which is into an annular drum, affording a large surface for heating air. These heaters are also shown with gas burning devices and water heating apparatus for combination heating. Two pages are devoted to the illustration and explanation of a new wood furnace.

The catalogue of the Pease Economy line opens with a broken view of the Pease steam and air combination heater, showing both the regular style and the low down construction. These heaters are also presented as water and air combination heaters, and as air heaters only. The Tropic heater, which is a cheaper construction, as well as the Pease, is designed for using both hard and soft coal. Both of these lines are made in a variety of sizes adapted for heating either residences or public buildings.

A Canadian Stove Catalogue.

The McClary Mfg. Company, London, Canada, have just issued from the press a substantially bound catalogue of 198 pages, illustrating various lines of stoves, ranges, heaters, &c., which they are offering in extensive variety. In the opening pages are directions for ordering goods, together with some comments which afford an idea of the volume of the company's business and the magnitude of their works. The leading place among the ranges is given to the Cornwall, a steel construction made with four or six cooking holes in the top surface, according to requirements, and adapted for using coal, coke or wood. This range is shown in several varieties, all of which are treated exteriorly in a way to attract the eye. Another member of this class is the Kootenay, which, while constructed on the same general lines as the Cornwall, is offered at a less price. The Army is a heavy steel plate range, made in sizes ranging from one to 12 boiler holes in the top surface, and is therefore especially constructed for hotels, restaurants, boarding houses, clubs, public and private institutions, and in fact all places where cooking operations for a large number of people are necessary.

Following the steel ranges attention is given to cast goods, which are shown with the Famous Active range in the leading place. This is followed by the Kitchener ranges and Kitchener cook, the Famous Model range and cook stove, the Maryboro cook for wood only, together with an extensive assortment of goods of cheaper construction. The leading parlor heater is the Famous base burner, made in two sizes with and three sizes without oven. The Famous hot blast heater, the Belle Oak, the Yukon triple heater, being in effect a handsome Todd stove, the Beechwood, a neat box stove for wood only, and a varied assortment of Famous air tight heaters, laundry stoves, &c., follow. Brief attention is given to the Famous gas range and hot plates, also to many varieties of camp stoves, which are in special demand in the northern sections of the continent. In the way of furnaces the catalogue shows the Sun-

shine, the Famous Florida, the Famous Eclipse, the Comet and the Famous Magnet. An assortment of miscellaneous goods, including registers, hollow ware, &c., occupy the concluding pages. Not the least important feature is a table showing the approximate weight of repairs in pounds for wood stoves, also for coal and wood stoves, and the approximate weights of fire pots and grates. A telegraphic code completes the volume.

The Independent Stove Pipe Radiator.

We present herewith a broken view showing the internal construction of what is known as the Independent stove pipe radiator, which is being manufactured by the Independent Register Company, 154-158 Champlain street, Cleveland, Ohio. The steel shell is filled with radiating tubes $1\frac{1}{2}$ inches in diameter and from $7\frac{1}{2}$ to $8\frac{1}{2}$ inches long, according to the size of the radiator. These tubes pass from the back to the front of the smoke chamber and are open at both ends. In the rear of the smoke chamber is an air shaft, closed at the top and open at the bottom, which draws the air from the floor, where it is always coolest, and feeds it to the radiating tubes. The company point out that the con-

The Independent Stove Pipe Radiator.

struction is such that in their passage to the chimney the products of combustion pass over these tubes with their large radiating surface, thus utilizing to the fullest extent an immense amount of heat which would otherwise escape by means of the smoke flue. This arrangement also makes each tube a separate radiator and the air passing through is raised to a high temperature, which is maintained as long as there is any fire in the stove. At the same time it causes a moderate circulation throughout every part of the room, tending to maintain a uniform temperature.

This stove pipe radiator is adapted for use in connection with any fuel, except soft coal. Some sizes are made with nickel plated tops, bases and legs and with body of American Russia iron, while other sizes have a body of cold rolled steel and aluminum finish tops, bases and legs. The radiator is of such a style and finish that it can be used in any room on the second floor and will keep it at a comfortable temperature by utilizing heat which would otherwise be lost up the chimney. The company have issued a little folder, illustrating and describing the radiator, and at the same time showing the manner of its application. The makers have also recently sent out an advertising novelty in the shape of an imitation pocket book, upon opening which is revealed a broken view of the radiator accompanied by reference to some of the claims made for it.

CAREY A. MOORE, the Acorn enthusiast, who represents Rathbone, Sard & Co., Albany, N. Y., in the South, with headquarters in Baltimore, visited the iron ore fields back of Duluth while on his vacation, and was much impressed with the methods of doing big things unassumingly in that center of activity.

STOVE FOUNDERS' AND METAL WORKERS' AGREEMENT.

Representatives of the Stove Founders' National Defense Association, in conference at Chicago with representatives of the Metal Polishers', Buffers' and Platers' Union, have drawn up an agreement which puts the two organizations on substantially the same footing on which the Stove Founders' and the Iron Molders' Union have been for many years. Those present at the conference on behalf of the Stove Founders' National Defense Association were: C. H. Castle, Quincy, Ill.; Henry Cribben, Chicago; D. S. Prizer, Reading, Pa.; Jeremiah Dwyer, Detroit, and D. McAfee, Quincy, Ill. The officers of the union, particularly President E. J. Lynch, have been agitating the proposal for an agreement for the past two years. The following is the text of the document drawn up at Chicago and signed by the representatives of the two organizations:

With the view of promoting harmony between the members composing the Stove Founders' National Defense Association and the Metal Polishers', Buffers' and Platers' Union in all matters affecting their joint interests, and providing the means for adjusting the grievances that may arise, we hereby signify our desire to adopt the principle of conciliation and arbitration upon equitable lines in such form and manner as may be hereafter mutually agreed upon, and we recommend as follows:

1. That a Conference Committee be formed, consisting of six members, three of whom shall be appointed by each organization to hold office for one year or until their successors are appointed.

2. Whenever there is a dispute between a member of the S. F. N. D. A. and the members of the M. P., B. and P. U., when a majority of the latter [the employees] are members of said union, and it cannot be settled amicably between them, it shall be referred to the presidents of the two associations before named, who shall themselves, or by delegates, give it due consideration. If they cannot decide it satisfactorily to themselves, they may, by mutual agreement, summon the Conference Committee, to whom the dispute shall be referred, and whose decision by a majority vote shall be final and binding upon each party for the term of 12 months. Pending adjudication by the presidents and Conference Committee, neither party to the dispute shall discontinue operations, but shall proceed with business in the ordinary manner. In case of a vacancy in the Committee of Conference it shall be filled by the association originally nominating. No vote shall be taken except by a full committee or by an even number of each party.

ODD PLATES.

THE PEERLESS STOVE & RANGE COMPANY of 44 West Naghten street, Columbus, Ohio, describe some of their leading Gas Heaters in a neatly printed pamphlet of 16 pages which they have issued. Prominent among the goods is the Triple Action, intended for using natural gas as a fuel. It is a closed Base Heater, the interior construction consisting of a system of 3-inch tubes open at the Stove bottom and extending to the main top. The cold air in passing through these tubes becomes highly heated and is discharged into the room through a fancy open work top plate. There are four horizontal plates, so arranged as to make the gas and hot air travel back and forth through four chambers until the burnt gas escapes into a flue, while the hot air passes into the room. The burner is cast iron and will not "flask back." The body of the Stove is of planished iron with rounded back corners. The Peerless Queen is another closed front Heater for natural gas and very much resembles a fireplace in appearance. The Juniata, for natural gas, is of the radiator type, having 6-inch planished iron tubes with cast base. Another novelty is the Florida, which is offered as a Double Heater, having an open front and using natural gas as a fuel.

THE MISKIMEN FURNACE COMPANY of Logansport, Ind., were recently organized with a capital of \$50,000 to manufacture Furnaces and Heating Appliances. The officers include George W. Miskimen, president; H. J. Crismond, vice-president; G. W. Walters, treasurer, and H. T. Tomlinson, secretary.

THE NONPAREIL GAS STOVE COMPANY of Chicago, Ill., have been incorporated with a capital of \$2500 for the

purpose of manufacturing Gas Stoves. The incorporators are W. F. Nichols, W. E. Mathews and L. R. Koretz.

At a recent meeting of the directors of the Reading Stove Works, Orr, Painter & Co., proprietors, Reading, Pa., it was decided to issue preferred stock for the purpose of making needed improvements to the plant and to extend the business. We understand that the stockholders recently decided to create a voting trust which will control the management of the business for a period of five years, the trust to be composed of five members. The company are doing a very large business, and the prospects for a heavy fall trade are exceedingly bright.

The new standard price-list on Mica, just issued by Eugene Munsell & Co., 218 Water street, New York, will be of interest to the Stove trade. The company carry a complete stock of all sizes of selected North Carolina and Wyoming Mica, and they call particular attention to their assorted packages, put up expressly for the retail trade. These packages are of 1, 2 and 3 pounds, containing respectively 4, 8 and 12 sizes of Sheet Mica.

KRAMER BROTHERS, Dayton, Ohio, are calling special attention, by means of an illustrated leaflet, to their Gem Stove Pipe Damper. This device is made with a long and sharp pointed spindle and is provided with a nickel plated handle of attractive appearance. These Dampers are made in 3, 3½, 4, 4½, 5, 5½, 6, 7, 8, 9 and 10 inch sizes.

THE F. MEYER & BROS. COMPANY, Peoria, Ill., manufacturers of the Handy Furnace Pipe, have let the contract for rebuilding the part of their plant which was recently burned. Three motors will be all the new machinery required, and these have been purchased.

THE AMERICAN VAPOR STOVE COMPANY are breaking ground for a large brick addition to the Dangler Stove factory in Cleveland, Ohio.

The first Stove made at the works of the Hanks Foundry Company, Rome, Ga., was turned out the first week of July and was placed on exhibition at the Hanks furniture store.

THE MONARCH STOVE & MFG. COMPANY division of the American Stove Company, Mansfield, Ohio, have just issued a new 36-page catalogue of Monarch Gas Heaters and Ovens, Hot Plates and Water Heaters, a line which has just been completed for the fall trade. Their salesmen are already in the field and at this early stage of the campaign are booking a very satisfactory amount of orders for these goods.

THE WEST SHORE STOVE COMPANY of New York have recently been incorporated with a capital of \$1,000,000. The directors include C. C. Bean, J. B. Conkling and Albert Schmid, all of New York City.

THE TOWNLEY STOVE COMPANY, Terre Haute, Ind., have recently gotten out a new line of stationery in the form of billheads, lease notes, receipts, statements, &c. on the back of each of which is a liberal display of advertising matter relating to the leading lines which they handle. By this means the company keep their goods constantly before the trade and make their stationery serve a double purpose.

Marvel Nutmeg Grater.

Franklin Specialty Company, 627-631 Franklin street, Reading, Pa., are manufacturing the Marvel nutmeg grater, which is so made that a whole nutmeg can be placed in a suitable pocket or receptacle and by pressure of a round wire spring, parallel with the cast iron handle, about 8 inches long, the nut is forced automatically against a perforated disk grater about 2¾ inches in diameter, which by means of a cast iron handle is revolved with the remaining hand. The advantage of this construction is that the nutmeg is kept in place, always ready, and can be used up entirely without necessitating any contact of the fingers either against the nut or the grating surface. The entire surface, which is of iron, is tinned. This company also manufacture a full line of 10-cent goods in the way of hardware specialties, including cast iron hammers, towel racks, clothes line hooks and goods of kindred character.

American Wonder Raisin Seeder.

George Borgfeldt & Co., West Third, Fourth and Wooster streets, New York, are introducing the American Wonder raisin seed extractor, for family use, as here illustrated. In operation raisins to be seeded, after being moistened, are fed into the upper left hand aperture, when a turn of the crank forces a series of small gauge nicked steel pins, covering a ¾-inch circle, through the fruit and against a rubber cushion perforated to receive the pins, thus pushing the seeds out. The various steel working parts, which are all nicked and polished, are automatically controlled by the irregular shaped stamped steel cam or plate, ridged on the

American Wonder Raisin Seeder.

inner side and secured to the crank shaft, by means of which the pins are thrown forward and withdrawn, at the same time two steel arms set at different angles wiping away at the proper time both the seeded berry and the seeds. The action of this machine leaves a raisin seedless, but does not mangle or mutilate it, the subsequent cooking process swelling the raisin to its original form before curing. It is a high grade article, the standard being black japanned. It is 6¾ inches long from front of crank to back of standard, about 5 inches high, not including the screw, has a 1¼-inch opening for clamping to table or shelf and weighs 18 ounces.

Roasting and Carving Rack.

The accompanying cut represents a rack on which to roast and carve meat or poultry, offered by A. E. Faber, Jr., 355 Mulberry street, Newark, N. J. It consists of a 10-inch square metal rod, upon which is one stationary and one adjustable rest, the latter sliding on the rod to accommodate the length of the roast. After the meat

Roasting and Carving Rack.

has been roasted the rack and meat are lifted together and placed on a platter. Among other points of excellence the manufacturers allude to the following: That the use of the rack admits of perfect roasting in all parts; that when placed on the platter carving is done with ease and comfort, the roast being held firmly, allowing the use of the fork to hold and distribute the pieces cut off; that the rack firmly secures the roast in a desirable position and provides space under and about the meat for gravy or decoration.

GLEN RIDGE, N. J., will issue \$8000 worth of bonds for making additions to the heating and ventilating plants in the public schools.

Fishermen's Equipment.

It is the season when those who handle sporting goods and cater to the trade of fishermen will do well to consult Catalogue No. 1 of the National Enameling & Stamping Company of New York City. One of its features is the variety of fishing tackle boxes, made in three different sizes and arranged with trays to lift out, divided into compartments for fish hooks, snoods, flies and artificial bait. The space below the trays is amply large enough for carrying reels, sinkers and lines suited for different kinds of fishing. Minnow buckets, another specialty in this line, are made in different styles and several sizes, some with perforated tin insets and some with woven wire insets. Care has been taken to construct these buckets so that there are no sharp corners to interfere with the movements of the minnows or injure them. The construction of some of these goods is such that they can be used either as floating or sunken buckets to keep the bait alive. The goods are neatly finished in attractive colors.

Side Lift Cold Blast Lantern.

The Berger Mfg. Company, Canton, Ohio, have just added to their line of lanterns the new Side Lift Cold Blast No. 2, shown in the accompanying engraving. The

Side Lift Cold Blast Lantern.

manufacturers claim this to be a distinct advance in lanterns and describe it as throwing a stream of clear, white, smokeless light, resulting from a perfect combustion, "which the fiercest gales cannot blow or the 'fiercest' roads jolt out." A side lift for the globe makes it convenient to light. It is strongly made of the best materials and is light to handle withal. The lantern is provided with a No. 2 burner, a 1-inch wick and a Cold Blast globe. They are furnished packed in cases of half a dozen.

The Tokheim Measuring Pump.

The Tokheim Mfg. Company, Cedar Rapids, Iowa, are offering the oil and gasoline measuring pump shown herewith. The pump, illustrated in Fig. 1, can be set in any convenient location in the store, as it is not necessary to set the pump on the tank nor directly over the tank in the basement, as it will draw oil. It is explained, 1000 feet from any angle if desired. This allows the merchant to place the oil tank underground at a fire proof distance from the building, where the oil supply is out of the frost in winter and out of the sun in summer and always convenient for filling. The pump is all metal and is referred to as being fume and vapor tight. The tank is supplied with a float indicator, also a 1 1/4-inch shut off valve on the supply pipe, so that in case of fire in the store the valve can be closed to protect against explosion and burning of the oil. The spe-

cial feature of the pump is the dome shown in Fig. 2. This is made of heavy flint glass, hand engraved, and, it is stated, measures a gallon or part of a gallon, United States standard, correctly. The manufacturers explain that it computes a gallon or any fraction of a gallon, from 1 cent's worth up, at any price, money value, in plain sight of the merchant and the customer. The pump does not depend upon the cylinder for the meas-

Fig. 1.—The Tokheim Measuring Pump.

urement and therefore, it is remarked, can be operated more easily than if a tight packing was required on the plunger in the cylinder; also that the wear on the cylinder has no effect on the measurement. The company

Fig. 2.—The Glass Dome.

make a specialty of extra heavy steel oil tanks for underground purposes, rust proof outside. The point is made that the foregoing device for handling oils and gasoline is highly recommended by insurance companies and city fire departments.

F. L. HELMES COMPANY have succeeded the late W. P. Kyle in the Hardware, Stove, Crockery and Tin Roofing business in Orlando, Fla. The new proprietors have remodeled the store and increased the stock and will be pleased to receive catalogues and other printed matter relating to the above lines.

Keeping Track of Contracts and Jobs.

J. W. Cooney, plumbing contractor, 355 West Twenty-sixth street, New York, has in use the system herewith described for keeping track of plumbing contracts and jobbing.

SHEETS AND BOOKS.

In addition to a journal and ledger, the following sheets and books are used in the system: Estimate sheets, foremen's orders for material from shop, ma-

ten across one end, and it is filed in alphabetical order with other estimates.

FOREMEN'S ORDERS.

Foremen are supplied with slips of plain ruled paper upon which to write orders for material required on contracts, to be filled from the shop. An order of this kind is shown in Fig. 2. A large stock of material is carried

Keeping Track of Contracts and Jobs.—Fig. 1.—Estimate Sheet, Actual Size 7 3/4 x 17 1/2 Inches.

terial book, orders on material houses, invoice book, time sheets, time roll book, contract account book and charge sheets.

ESTIMATE SHEET.

A reproduction of the estimate sheet is shown reduced in Fig. 1. This sheet is of manila stock paper, 7 3/4 x 17 1/2 inches in size. At the head of the sheet are provisions for full information regarding the building, name of the owner, builder and architect. Estimating the cost of a contract is done on this sheet, the printed form, in a measure, obviating the danger of omitting materials which would be required. The articles printed on the sheet usually fill all requirements, but if not names of additional material are written on some of the unused lines. When the estimate is completed the sheet is folded, the name and number of the estimate is writ-

man's order. All material returned from the job is credited on this book.

ORDERS ON MATERIAL HOUSES.

A reproduction is shown in Fig. 4, reduced, of an order on a material house. These are bound three to a page and are perforated, so as to be readily detached. Alternating with the pages of orders are pages for duplicates, of colored paper, on which carbon copies are taken and kept in the shop. It will be noticed that a request is made that the order number be put on the invoice. At the bottom of the order is a memorandum indicating to which contract the material is to be charged. When the invoice is received it is checked up

at the shop, and it is not often that articles have to be ordered for contracts from material houses. The items checked in Fig. 2 indicate that they were obtained from the shop, while the X shows that an order had to be made for that item. The location of the job is given at the top of the order, and the foreman signs his name at the bottom. Upon arriving at the shop the helper gets out the material called for on the order, under the supervision of the bookkeeper, who checks the items.

MATERIAL BOOK.

One or more pages in the material book are given to each contract, as judgment suggests. In this book, a portion of a page of which is shown in Fig. 3, a record is kept of all the material that left the shop on the fore-

Fig. 7.—Invoice Book.

the work was done is placed after the name of each workman. The names are always entered on the time roll book in the following order: Foremen, workmen, helpers and then the office force. The wages for the

week are footed up and the amount necessary to make the payments is drawn from the bank.

INVOICE BOOK.

A portion of a page of the invoice book is illustrated in Fig. 7, reduced. As invoices for material are received from material houses they are immediately checked and entered on this book. The book is ruled so that each invoice can be charged to the contract for which the material is used. A column is provided for expenses such as cartage, &c. At the end of each week the labor on each contract is entered in the column devoted to labor. This is obtained from the time roll book, compared with the time sheets.

CONTRACT ACCOUNT BOOK.

The contract account book, a portion of a page of which is illustrated in Fig. 8, reduced, is the book in which all charges against contracts are assembled by transferring them from the other books. A page or more is devoted to each contract account. It is headed at the left with the name of the contract and the contractor. At the right the contract price is entered with a line beneath on which to make a memorandum of extras. When all the invoices for the month have been received

they are transferred from the invoice book and are designated as "Bills." Labor and expenses are also transferred from the same book, "L" designating labor and "Ex" expenses. Material from the shop taken out on foremen's orders are transferred from the material book

rough; finished and polished and nickel plated. Emphasis is laid by the company on the uniform thickness of the walls of their Bibbs and Cocks.

A Sample of Trade Protection.

That the manufacturers and jobbers of plumbing supplies afford a liberal protection to the contracting plumbing trade is a fact that does not receive as much consideration as it is entitled to. Evidence of this is reflected in the following authentic account of the effort of a real estate agent to secure plumbing goods from a supply house which is said to sell to whoever applies for goods:

The real estate man entered the shop of a plumber who was well known to him, while the proprietor was absent, ostensibly to inquire the price of some work, and as the party in charge of the shop could not answer the question the plumber's card was asked for and received. Within an hour's time the plumber had returned to his shop and his friend who had taken charge of his business was still present when the telephone bell rang. An inquiry was made by the supply house in question whether or not he desired to have his customer receive goods at trade prices, or at any price, the statement being made that the customer had presented the plumber's card as evidence of good faith. Of course, the plumber said that he did not care to grant such a favor to anybody, and, in consequence, the real estate agent failed to secure about 10 dollars' worth of plumbing goods, although he showed his cash ready to pay for them. A little investigation proved to the plumber beyond question the identity of the real estate man and also satisfied the friend who had been in charge of his shop that it was the same man who secured from him one of the plumber's cards.

We are glad to be able to present this little example of trade protection, for, while there may be here and there an instance which doubtless has extenuating circumstances connected with it, where goods are sold to those outside of the trade, there is hardly room for doubt that in all cases, except the few which prove the rule, the manufacturers and jobbers of plumbing goods, in the support of trade protection, confine their sales strictly to the plumbers.

Turner Double Jet Gasoline Torch.

The Turner double jet gasoline torch, manufactured by Turner Brass Works, Chicago, is shown herewith. This blow torch is referred to as of the same general

Turner Double Jet Gasoline Torch.

appearance and construction as the ordinary blow torches now on the market, except the burner. It will be seen that there are two valves instead of one, as is customary in burners of this kind. In this double jet construction one valve controls the air blast and the other the gas. The air and gas enter the combustion chamber in separate jets, and are there united in a blue flame of intensity to fuse nickel, it is claimed. The independent control of the gas and air enables the operator to secure perfect combustion as occasion requires for different kinds of work, thereby securing the maximum amount of heat that is possible by mechanical means. The heat produced by the double jet is said to be 3000 degrees. The double jet torch is claimed to be capable of performing work heretofore considered impossible.

THE NEW DEPARTURE MFG. COMPANY, Bristol, Conn., for whom John H. Graham & Co., 113 Chambers street, New York, are selling agents, have just issued a new illustrated catalogue of Plumbers' Brass Goods, which is a new line with the house, showing Compression Bibbs, plain and hose, with T handles, both for lead pipe and iron pipe with shoulder. They also make Lever Handle Bibbs for lead and iron pipe, Brass Racking Cocks, fast and loose key to screw or drive, Brass Liquor Cocks, Bottling Cocks, Compression Lock Cocks, Compression Wash Tray Bibbs, &c. They can be furnished in the

DOMESTIC GAS WATER HEATERS.*

BY W. B. CALKINS.

By the term domestic water heaters we refer to such heaters as use gas for fuel and are placed in connection with the ordinary kitchen boilers for the purpose of heating large or small quantities of water. If a gas company are so situated that they have to compete with a strong coal market a good water heater, properly connected, will serve a twofold purpose: 1, Of furnishing quickly and economically a large or small quantity of hot water; 2, of serving to keep fuel gas in use all the year around. If the climate is not too severe a good water heater tends to lengthen the life of the gas range two or three months, if not keeping it in use the entire year. In order to determine the efficiency of the different makes of water heaters a series of tests were made by the Denver Gas & Electric Company, the details of the tests being as follows:

Each pressure heater was set in position, as shown in Fig. 1, the cold water inlet being connected to a 30-gallon boiler, and the flow of water through the boiler and heater was regulated by a valve on the cold water inlet to the boiler. The hot water from the heater was not allowed to return to the boiler, but was conducted to a measuring tank through a short piece of hose. The water used in these tests was drawn from the city mains; the temperature of the ingoing water was taken before each test and found to be very constant.

In each test the temperature of hot water coming from the heater was allowed to become constant before the test was started. The temperature of hot water was taken several times during the test to see that no variation took place. The gas was passed through a portable five-light test meter, and the number of cubic feet burned was carefully noted. In each test 5 gallons, or 41.75 pounds, of water were passed through the heater and timed with a stop watch. Each cubic foot of gas

Domestic Gas Water Heaters.—Fig. 1.—Apparatus Connected for Test.

burned represented 540 B. T. U.; which number was taken as a basis of calculation in all tests. The average gas pressure was about 19-10 inch of water.

As a great many tests were made on each heater, we will give only that one showing the greatest efficiency.

Water heaters Nos. 1, 2, 4a, 4b and 5 are the ordinary small pressure water heaters; heater No. 3 is of a larger type, better adapted for barber shops or small bath houses, as it occupies too much space for the ordinary kitchen.

The efficiency in each series of tests can easily be raised by allowing a greater quantity of water to flow through the heater, thus lowering the temperature, also cutting down the time in which the required quantity of water passes through the heater; this, in turn, lessens the number of cubic feet of gas burned. But this rapid

motion does not take place when the heater is properly connected with the boiler, as the only movement of water is that caused by the heat. This slow circulatory movement we have tried to imitate in all tests. Other tests were made in order to determine the best method of connecting the heater with the boiler, and from these tests we have deduced the following directions:

1. If possible, always connect the heater to the boiler so that the base of the heater will be on a level, if not

Fig. 2.—Right Connection.

Fig. 3.—Wrong Connection.

a little below the bottom of the boiler. This allows for the free circulation of all the water in the boiler.

2. Connect the hot water outlet from the heater to the top of the boiler. This connection answers all purposes much better than the side connection.

3. Flush cocks should be placed on the bottom connection of all heaters, by which the heater, boiler and pipes can be flushed as often as needed.

4. All water heaters should be connected by a flue pipe to the chimney.

5. Cocks should be placed on the cold water connections between the boilers and the heaters. By this arrangement any back movement of hot water can be stopped after the fire is turned out under the heater; this prevents the heater from becoming a cooler. Other directions for the economic use of the water heaters should be prepared for the use of the people buying them, but as these will be more or less of a local nature we will not discuss them.

In the discussion of this paper F. W. Stone presented the following remarks:

The paper presented by Mr. Calkins is a most interesting one, and the subject is one of great importance to all sellers of gas. The tests given undoubtedly would show the efficiency of the different makes of hot water heaters, but it would seem to me that the most practical test would have been to have connected up the heater directly to the hot water boiler in the same manner in which it would be connected in the ordinary dwelling house, and then, by means of a thermometer, to have ascertained the rise in the temperature of the water in the boiler at different levels, because, as Mr. Calkins has said, the flow of water, when induced simply by a rising temperature, is more sluggish and quite different from that produced mechanically. The tests also seem to indicate a low efficiency. I have not the figures with me at present, but have made tests of hot water heaters, which, burning gas having approximately 650 B. T. U.'s per cubic foot, gave an efficiency from 70 to 75 per cent.

I have found more difficulty in educating plumbers to connect up domestic water heaters than I have in determining which heater was the best, and I believe that it is just as important, even more so, to have the heater connected properly as to have an efficient heater, and show in Figs. 2 and 3 a right and wrong connection for guidance. In connecting up a domestic water heater, in addition to the points mentioned by Mr. Calkins, it is better to somewhat reduce the size of the pipe where it connects into the hot water pipe at the top of the boiler, and also to be always sure to connect into the side of the tee and not in at the end, for when you connect into the end the flow of hot water at a faucet will sometimes draw the cold water right through the heater, and you will hardly get any hot water at the boiler. While the circulating domestic heater must be used wherever you have the boiler connected with the water back in the range, yet I believe that, where gas alone is used for heating hot water, the instantaneous heaters are the most economical. The pilot light on an instantaneous heater can be adjusted so as to consume but very little gas. There is no quantity of water to keep hot all the time, and they are arranged so that the flow of water caused by the opening of the faucet turns on the gas, and the water is heated as it passes through the heater.

I know of one make that will guarantee that, with

* Paper read before the Ohio Gas Light Association at meeting in Columbus, Ohio, March, 1902.

artificial gas testing 700 B. T. U., 1 foot of gas will heat 1 gallon of water from a temperature of 55 to 130 degrees. This would indicate an efficiency of over 89 per cent., which is much better than that indicated by the tests given by Mr. Calkins, and the outlet temperature is also much higher. The ordinary 30-gallon hot water boiler has 15 feet of radiating surface, and in the circulating type of domestic heaters it takes considerable gas to keep up the heat which is radiated by the hot water from this amount of surface.

A New Steam Goods Catalogue.

A very useful piece of trade literature has just been issued in the new catalogue of the Sumner & Goodwin Company, 287-289 Congress street, Boston, Mass. It consists of 367 pages and is divided into sections. The first section is devoted to wrought iron pipe and fittings and, in this connection, the announcement is made that the company are prepared to furnish pipe cut and threaded to sketch, from $\frac{1}{8}$ inch in diameter to 18 inches in diameter. A special diagram is presented with an explanation of how to order pipe, valves, unions and fittings to sketch, so as to avoid any error in measurement. The weight, thickness and the number of threads to the inch of standard, extra strong, double extra strong and large O. D. pipe are first given, followed by information in reference to lap welded casings, boiler tubes and their couplings. The next section of the book is devoted to cast iron fittings, a complete list of the standard sizes of elbows, tees, crosses, offsets, reducing couplings, &c., being furnished, followed by illustrations and list prices of fittings, such as return bends, Y's, return bends with outlets, flange unions, reducers, eccentric tees, plugs and bushings and a long list of malleable iron fittings. The catalogue also presents an extensive line of standard flange fittings with tables of dimensions in reference to them. Another section is occupied by cast iron drainage fittings, manifolds, hook plates, pipe hangers and ceiling plates.

Brass fittings, malleable pattern, comprising unions and railing fittings, standard brass valves and cocks, with check valves, throttle and safety valves, gas and service cocks form another section. Special valves, including horizontal and angle, check valves, radiator valves, flange angle and cross valves, butterfly and vacuum valves, hose valves and positive and automatic air valves, with brass steam swing joints and expansion joints, occupy a number of pages. Iron body and special valves and cocks, including globe and angle valves for all sizes of iron pipe, iron body check valves, back pressure valves, blow-off valves, pressure regulators, three-way cocks, iron body foot valves and strainers are then presented, while gate valves with brass or iron body and special valves occupy another section. Twenty pages are devoted to a special line of valves and boiler equipments manufactured by the Lunkenheimer Company. These are followed by 20 pages of goods manufactured under the name Belleville.

Another section of the catalogue is devoted to engine and boiler trimmings, pet cocks, water column bodies, gauge glasses and cutters, whistles, oil cups and a variety of lubricators, together with steam gauges and thermometers. Steam and hot water appliances, consisting of injectors, steam traps, return steam traps, Lawler's water feeders, exhaust pipe condenser heads, expansion tanks and governors and brass gas fixture fittings and brackets, including a variety of burners for both coal and acetylene gas, are then shown. Vertical sectional and round hot water and steam boilers are followed by the Triton and Chautauqua radiators, indirect radiators and radiator pedestals.

Water work supplies include a complete line of plumbers' brass goods, pressure regulators, unions and brass water connections. Hose goods include everything for equipping modern buildings with fire protection apparatus, and also for lawn and garden purposes.

A section devoted to pumps, hydrants and service boxes includes lift and force pumps, hydraulic rams, power pumps and service boxes, belting and miscellaneous supplies, which include pipe covering, bronzing liquid, enamels and metal polishes, are followed by tube expanders and cleaners, oilers, shovels, wheelbar-

rows and trucks. In the last section of the catalogue are shown steam, gas fitters' and machinists' tools, embracing pipe cutting and threading machines, both hand and power, pipe wrenches, drills, plyers, tapes, solder pots, fire pots, torches and tool chests. The catalogue closes with a well arranged index.

The Holden Combination Water Heater.

The growing custom of supplying the tenants of apartment houses with hot water has brought with it a demand for apparatus for this purpose. In sections where coal and, at times, natural gas are available, the demand for a combination apparatus using either of these fuels, has resulted in the production of the Holden water heater, by the Knight & Jillson Company, 123 South Pennsylvania street, Indianapolis, Ind. This heater was originally constructed in two sizes, using natural gas and designed for connection in the usual manner with the ordinary kitchen boiler. Its efficiency led to the production of larger sizes for use in coal

The Holden Combination Water Heater.

burning apparatus, and finally to the production of the combination apparatus, a broken view of which is shown herewith. The heater proper consists of a malleable iron, cone shaped cylinder, exposing to the fire a large amount of surface in proportion to the contents. The material of which it is constructed and the thickness of the walls enables the cone to stand a hydraulic pressure of over 1000 pounds.

Whether used for natural gas or coal, the construction provides a sediment chamber well below the fire line. It is claimed that in sections where lime water is used this location of the cone avoids encrusting with lime and choking. For cleaning, the cone is supplied with a brass plug near the bottom. For coal burning a convenient feed door is provided, and the grate is arranged to rotate so as to remove fine ashes. It is pointed out that in case a large quantity of water is needed quickly, both gas and coal fires can be used; or, should the gas pressure be particularly low, the heater can be operated with coal alone, and that in every case the consumption of fuel is light in proportion to the quantity of water heated. The heater is said to be equally well adapted to the use of artificial gas though this gas not being so rich as natural gas, does not heat the water so quickly. The claim is made by the manufacturers that the heater is so simple in construction that there is no difficulty in connecting it up or in operating it.

The International "F" Series Boilers.

A new boiler which has just been produced by the International Heater Company of Utica, N. Y., is shown in the accompanying illustrations. This boiler is made by the house with a view to meeting the demand for a round construction that embodies the features of convenience, efficiency and economy. In detail the construction consists of a deep ash pit equipped with a large ash door, in which swings a draft door to be operated by an automatic draft controller. The ash pit also supports the grate bars, which are connected by means of keys, with the bars attached to the shaker lever, and the grate stop is so arranged that by a simple movement the grate bars can be made to stand in a vertical position to free the fire pot of all of its accumulation. The water leg section, which is the fire pot, is deeply corrugated to promote combustion and not only adds materially to the fire surface of the boiler, but it also has radial arms extending inwardly at the top to form an auxiliary crown sheet. These waterways incline upward toward a central water passage through which, by means of large screw nipples, the water passes to the upper sections. The upper sections are arranged with ample smoke flues between them and are connected by means of staggered openings so as to extract, as far as possible, the principal heat from the products of combustion. In the upper section an adjustable baffle plate is arranged so that the draft may be controlled and the smoke outlet made larger or smaller, as the condition of the weather may require. The smoke dome at the top is fitted with a check draft for further controlling the drafts.

The construction of the steam boiler can be seen in Fig. 1, while the construction of the water boiler is shown in Fig. 2, the difference being in the height of the top chamber, which forms the steam drum in the steam heater. The boilers are made in 11 sizes for steam, having capacities of from 225 to 1200 square feet of direct radiation and the water boilers in ten sizes, with capacities ranging from 500 to 2000 square feet. The different sizes of the boilers have grates 15, 18, 21, 24, 28

Fig. 1.—Steam Boiler.

Fig. 2.—Hot Water Boiler.

INTERNATIONAL "F" SERIES BOILERS.

and 32 inches in diameter, the different capacities being effected by the insertion of an extra upper section. The total height of the steam boilers to the top of the outlet ranges from 54 inches in the smallest to 68 inches in the largest size. The company have recently issued a catalogue with a separate price-list, giving full particulars in reference to these boilers.

Robertson's Filter.

The desirability of pure water for drinking purposes has led to the production of various filters for this purpose. In the accompanying illustration we show the Robertson germ proof automatic cleaning filter, made by the Robertson Mfg. Company, 203 West Utica street, Buffalo, N. Y. Owing to the facility with which the matter in water to be filtered will adhere to soft ma-

terial, the filtering rock selected for use in the Robertson filter is said to be of diamond hardness and to absolutely prevent any absorption of matter. The construction provides for a complete and perfect cleaning by simply reversing the turn stem down, shown at the base of the filter, after removing the cap, causing a re-

Robertson's Filter.

verse action, forcing the air and water through the filtering mediums and loosening and removing instantly all matter or germs deposited on the rock surface, which are carried off through the open ports. For convenience in attachment, the company furnish a wall plate into which the bracket of the filter adjusts itself, and from which it may be detached at any time. A hose pipe connection is also furnished with this filter, so that it may be connected as shown by means of dotted lines. The filter is made in a variety of sizes adapted for the requirements of residences, public buildings, hotels and places where a large supply of pure water is desired. The company have just issued special circulars devoted to this device.

Chandler Pump Catalogue.

The Chandler Pump Company of Cedar Rapids, Iowa, with a branch house at Kansas City, Mo., have just issued their pump catalogue No. 8, bound in a red cover and consisting of 216 pages. Following the title page is a bird's-eye view of the company's plant, with a picture of their Kansas City office. After an announcement to the trade, calling attention to their terms, extensive plant and exhaustive line of pumps and kindred supplies, special directions are given for setting wood pumps, with a note in reference to iron and porcelain cylinders, followed by directions for setting iron pumps. The first section of the catalogue is devoted to wooden cylinder pumps and wood curb chain pumps for ordinary and deep wells and for cisterns. Cast iron pumps come next, beginning with pitcher pumps, combined lift and force pumps, double acting house pumps, anti-freezing pumps, special pumps for wind mills and drive wells, open top and closed top hand pumps, patent packing tube, tubular well pumps, and pumps with three-way cocks and levers, or with compression valves. Another section is occupied by double acting force pumps for hand and wind mill use, among which is the Hawkeye, a double acting tank pump, having a capacity of two barrels per minute. The Hawkeye spray pump and fire extinguishers are then considered, and several pages are devoted to iron, brass and brass lined cylinder pump

valves, valve and plunger leathers and a price-list of the various parts of the different pumps made.

The next 20 pages contain reference to tubular well cylinders, drive points, earth augers, drills, valve grabs and various styles of couplers and check valves. Wind mill pump stuffing heads, float valves, air chambers, pipe dogs, pipe lifters, wind mill regulators and tackle form another section of the catalogue. The succeeding pages are devoted to steel and wooden water storage tanks, followed by pictures of the Hawkeye heater for heating the water for stock use, and the Dewey automatic stock waterer, designed to always have a supply of fresh water in the drinking fonts. Street hydrants, enameled sinks and brackets and slop sinks are followed by laundry trays, kitchen boilers and a complete line of malleable pipe and railing fittings, wrought iron pipe and cast iron fittings, including manifolds, hook plates, pipe hangers and ceiling plates. Plumbers' brass goods, including stop and waste cocks, sill cocks, lever handle and compression bibbs. Fuller bibbs and wash basin and pantry cocks are then presented, the remainder of the catalogue being devoted to brass goods adapted for the use of steam fitters and hose, belting and packing, as well as a variety of steam fitters' tools. The catalogue closes with a well arranged index.

THE AMERICAN RADIATOR COMPANY'S NEW PUBLICATIONS.

We have received from the American Radiator Company, Chicago, copies of three interesting publications which they are just distributing to the trade. These publications comprise a *brochure* entitled "The Homes Successful," a catalogue of the Acme fire box boilers, and a pamphlet entitled "Heating Advertisements that Aid."

THE HOMES SUCCESSFUL.

This is the twelfth edition of a most interesting presentation of the merits and advantages of hot water and steam heating. It is one of the most artistic specimens of trade literature ever brought out. It is not only most beautifully printed, but every page is adorned with illustrations which are reproductions of photographs. The nature of the illustrations is such as to illuminate the text, and consequently make what would ordinarily be dry or technical reading attractive to the general public. The arrangement is happily conceived, as the ordinary catalogue devoted to a description of heating apparatus is not very interesting to the ordinary reader. The man or woman who takes up this dainty publication, however, will be fascinated by its style, and will hardly lay it down until every page has been not only carefully read, but its statements have been given serious consideration. This edition of the publication is bound in a heavy paper cover, which is illustrated in colors.

ACME FIRE BOX BOILERS.

This catalogue gives full details regarding the construction of the Acme fire box boiler, which is designed for low pressure steam heating, or for heating by hot water. The Acme boiler differs from the ordinary horizontal tubular steam boilers sold for low pressure heating in the important particular that the fire box is inclosed in the boiler, thus making it internally fired, which necessarily causes the maximum efficiency of the fuel to be utilized for heating the water. The close proximity of the fire to the shorter tubes employed distribute far more conveniently the products of combustion, especially where a slow, deep fire is maintained. This boiler is especially adapted for installation in low cellars, and is arranged for the use of either hard or soft coal as a fuel, or for use as a wood burner. It can be brick set, or installed in portable form. It is made in 14 sizes, having a capacity ranging from 850 to 5800 square feet of direct steam radiation, and from 1350 to 9300 square feet of direct water radiation. The illustrations give a perspective view of the boiler, a broken view showing the construction of the fire box, another broken view showing the smoke travel, and a number of small illustrations of the fire box, grate, arch plates, rear covering plate, slide damper, &c. Complete direc-

tions are given for setting the boiler. The catalogue further contains illustrations of tank heaters, storage tanks, radiators, and an interesting chapter relative to the construction of chimneys, as well as a very complete telegraphic code for ordering by wire.

HEATING ADVERTISEMENTS THAT AID.

The American Radiator Company pay a great deal of attention to the education of their customers in methods of increasing trade. They endeavor in every way to assist their customers to extend their business. From time to time they have issued hints of methods which can be adopted in stimulating the local interest in hot water or steam heating. The pamphlet which has just been issued under the above title is a more elaborate presentation of methods of advertising by heating contractors. The work contains a very large number of prints of electrotypes, of which the company will loan the use of duplicates, having a space left in a blank for the insertion of the name of the steam fitter who is advertising in his local journals. These electrotypes display a great deal of originality in getting up attractive designs, as well as reading matter which presents telling points and catchy ideas. The publication itself is exceptionally well gotten up, and preserves in every respect the high ideals aimed at by the company in the preparation of their publications.

STEAM FITTERS' TRADE RESOLUTIONS.

The July number of the *Official Bulletin* of the National Association of Master Steam and Hot Water Fitters contains the following information relating to action taken at the national convention in Atlantic City in June, which will be of interest alike to the wholesale and retail trade:

Members, and manufacturers and dealers, are requested to note that no change was made in our

TRADE RESOLUTIONS

and it is, therefore, incumbent upon all who are "now in accord" to take such steps as will avoid any infractions by their employees or agents who are under their control. An important resolution that was adopted is as follows:

"Whereas, Certain boiler and radiator manufacturers canvass our prospective customers and make plans, specifications and estimates for them to our injury; and,

"Whereas, These boiler manufacturers endeavor to have tinsmiths do the work under the boiler manufacturers' supervising; therefore be it

"Resolved, That it is detrimental to our interests to purchase goods of boiler or radiator manufacturers who make plans, specifications or estimates on heating work."

The foregoing resolution was heartily supported by everybody present. There is very little doubt that the manufacturer who persists in making plans and specifications for people who are utterly incompetent to do a piece of work without their assistance will fare badly at the hands of the reputable master steam fitters, of which class this association is composed.

One of the recommendations adopted was to the effect that we notify manufacturers and dealers on our List in Accord that general contractors or building constructors doing steam heating and ventilating are not entitled to be placed on our Exempt Consumers' List.

This view is already held by many of the reputable manufacturers and dealers, and it will be a short sighted manufacturer or dealer who thinks he can do better by catering to such class of concerns instead of confining his sales to the trade—to wit, to master steam fitters who are his principal means of support year in and year out.

This association does not say that any manufacturer or dealer can sell or cannot sell to any particular person or class of customers, but it certainly must be clear, to all who have ordinary intelligence that manufacturers and dealers who do sell or quote to consumers that cannot be classed as being in the trade should be considered as not carrying out the spirit of our trade resolutions, and therefore not entitled to a place upon our List in Accord.

We expect our members to assist in placing the goods of all reputable concerns on our List in Accord, and if members turn a cold shoulder to those who do not think it worth while to protect them, there is no one to blame but themselves.

JOHN DUFF, custodian of the United States Post Office, New Bedford, Mass., will receive bids until July 30 for plumbing and other repairs to the building.

The British Tube Association Re-established.

Since the collapse of the British Tube Association nearly 12 months ago competition has increased and underselling assumed a most acute form. At length some of the leading manufacturers in the Midlands and Glasgow have decided to take steps to reorganize the trade and prevent the cutting of prices. The urgency of protective measures was emphasized when the recent advance of the minimum basis of gas strip to £7 a ton was declared. Accordingly a general meeting of the trade was held last week at Carlisle, as being the most accessible center for Scotch and Lancashire as well as Midland representatives. It is understood that there was a fully representative gathering, and after a lengthy discussion it was decided to reconstitute the British Tube Association, and that prices in the meantime be fixed on the basis of 72½ per cent. discount off the list of gas, steam and water tubes. A further meeting will be held to appoint a president, and it is expected that the headquarters will be fixed in Birmingham.

The American Radiator Company's New Boiler Plant.

E. R. Stoughton, the representative of the American Radiator Company, at Buffalo, N. Y., in an interview with a representative of the *Commercial* of that city, recently stated that the mammoth new plant for the manufacture of boilers for the company at Black Rock is expected to be completed and in operation in September. The building of this plant is said to be one of the best examples of rapid construction in the history of the city. When completed it will be one of the largest and finest boiler foundries in the country. It is built similar to the plant of the company at Detroit. The power for the new plant will be electric, a contract having been made with the Cataract Power & Conduit Company for 315 horse-power. The new plant is to comprise six buildings, the largest of which will be the foundry, which will cover a space 200 x 300 feet. The entire plant will be of modern fire proof construction, with steel frame and brick walls. The buildings will be covered with steel roofing, laid on rafters of the steel bridge construction type, and the completed roof will cover an area of 150,000 square feet.

New Valve Factory.

The Pittsburgh Valve & Fittings Company, whose incorporation under the laws of New Jersey was recently reported in these columns, have completed their organization with the election of the following directors: James I. Buchanan, William D. Hartupée, C. A. Verner, L. D. Castle, J. A. O'Neill and M. J. Alexander. The board elected W. D. Hartupée as president, and M. J. Alexander as secretary and treasurer of the company. A site for a large plant has been secured by the corporation at Barberton, Ohio, near the plant of the Columbia Chemical Company, both concerns being Pittsburgh enterprises. The buildings for the new plant at Barberton are already under way. The plans call for eight structures of stone and brick, one of which will cover 4 acres. They are to be located in a 75-acre plot, with direct communication with the Baltimore & Ohio, New York Central, Pennsylvania and Erie Railroad lines. The machinery for the plant is being constructed of special design, and each machine will be operated by an electric motor. The concern propose to manufacture their own brass, securing their supply of copper from Montana and their spelter from Illinois. A practically inexhaustible supply of core and molding sand is located on the company's property. It is scarcely necessary to add that the plant will be modern in every particular.

LEIGHTON & DAVENPORT, Bangor, Maine, bid \$1628 and secured the contract for installing a hot air heating system in the Union Street School in that city, this system having been decided upon as best adapted to the needs of the building. The company also secured the plumbing contract at their bid of \$770.

Pierce Boilers and Radiators.

The Pierce, Butler & Pierce Mfg. Company, Syracuse, N. Y., are sending to the trade a new catalogue of their line of steam and hot water boilers of both the surface burning and magazine feed types, which also shows a great variety of indirect, direct-indirect and direct radiators. The catalogue consists of 45 pages, 4 x 9 inches in size, and is provided with a convenient index. The first portion of the book is devoted to the company's steam boilers. The American boilers, which occupy the leading place, are of the vertical, sectional, return flue type, made with 20, 28, 36 and 44 inch grates, rated to carry from 550 to 5600 feet of direct steam radiation. These are followed by the Florida, Soleil, Touraine, Ontario, Florida Junior and Improved Giant boilers, all of round form and of a construction to enable them to be set up quickly by the steam fitter. Seventeen pages are devoted to the Advance, Spence, Perfect, Tropic, Touraine, Ontario, Tropic Junior and Giant water heaters, adapted for carrying from 60 to 9250 square feet of radiation. The Giant and Tropic Junior boilers are well adapted for small heating work, and are especially constructed with a view of meeting the requirements of hot water supply systems for domestic purposes, in large apartment houses, and in hotels and restaurants. In the last portion of the catalogue are shown the Lorraine radiators, which are made in one, two, three and four columns, and of all heights, from 18 to 44 inches, followed by the Bremen, Syracuse and Reliance radiators, which are made with both ornamental and smooth finish, and in all heights from 20 to 45 inches.

New York City Notes.

Richmond Branch, in proportion, seems to be the busiest just now. Nearly all the plumbers from Mariners' Harbor around to Tottenville report that they are busy.

* * *

With the exception of small houses in the new parts of the borough Brooklyn reports things as quiet. The time is not yet ripe there for the large elevator departments, which are the only profitable structures of the kind now built under the Tenement House rules.

* * *

W. Y. Jack & Co. are plumbing a new foundry that is being erected for the E. W. Bliss Company on Twenty-third street east of Second avenue; Howe & Bassett, in addition to their Tombs job, have a loft and a store building well under way at 247-251 Sixth avenue; John Tucker has a large warehouse for the New York Terminal Company, at Twenty-eighth street and Thirteenth avenue; Smith & Roffler are plumbing a flat at 229-233 West 124th street; John Rendall of the Bronx is well along in the plumbing of a large apartment house on Amsterdam avenue, between 183d and 184th streets, and Rody McDermott is plumbing four of the seven high-class private houses that are being erected on Fifty-first street, between Madison and Park avenues. James Armstrong is doing the other three.

* * *

The lower East Side is well represented in the new work just given out. William Nusser has three tenements at 346-350 East Twentieth street; B. W. Rod has two tenements at 38 and 40 Stuyvesant street, also at 229-231 East Twentieth street; P. Lauria has a row of tenements on Fourteenth street near Second avenue, also at 742 and 744 Sixth street; Richard Tretler has an apartment at 153 and 155 East Eighteenth street; Samuel Greenwald has an apartment at 141 and 143 West Tenth street, and George Dillon has a tenement at 233 and 235 Henry street.

ANDREW MCGLYNN & Co., Taunton, Mass., have secured the contract for plumbing and heating the new parochial residence of St. Mary's Church in that city.

THE annual meeting of the Canadian National Association of Master Plumbers will be held at Halifax, N. S., on August 13 and 14, with headquarters at the Queen's Hotel. Arrangements have been made for the entertainment of the delegates for a drive about the city on their arrival and a banquet on the evening of the 13th. On the 14th there will be an excursion on the harbor.

Lynn Master Plumbers' Banquet.

Through the courtesy of Secretary C. T. Dame, we have received the following account of the first annual banquet of the Master Plumbers' Association of Lynn, Mass., held in the hall in the Heffernan Block last Monday night, and which was a most complete social success:

The banquet was in itself a most elaborate affair and was heartily enjoyed by all present from the moment that the turkey and salads made their appearance until the party dispersed near midnight.

While those present were enjoying their after dinner cigars Walter H. Danforth, president of the Lynn Master Plumbers' Association, arose and briefly addressed the gathering, closing by introducing as the first speaker of the evening Daniel Shannon of Boston, president of the State Association, who spoke briefly, but to the point, offering some suggestions for the improvement of the organization and relating some of his experiences as a delegate while attending the conventions of the National Plumbers' Association at Atlantic City, Cleveland, and elsewhere.

The president then introduced Charles Chamberlain, Inspector of Plumbing for the City of Lynn, whose remarks were greeted with warm approval. He was followed by E. C. Stokes of Boston, who regretted the fact that so many plumbing shops are not kept in a state of cleanliness and assured his hearers that it is the clean, well kept shop that draws the best trade and makes the most money.

At the close of his remarks Eddie Mumford rendered several pleasing selections to his own accompaniment on the piano. Other speakers were Charles C. Brown, State organizer; R. L. Cochrane, Health Inspector at Nahant, and Patrick Gargan. William B. Daley gave a number of vocal selections and several character impersonations, while topical songs were sung by James Petrie.

Among those present were W. F. Brown, W. C. Quinby, J. F. Morgan, E. C. Stokes, R. L. Cochrane, Charles Chamberlain, Daniel Shannon, Charles C. Brown, James F. Ryan, Joseph McIlvery, George F. Stoddard, L. E. Gorham, William B. Daley, Edward Mumford, P. T. May, L. A. May, J. N. Pope, R. J. White, T. B. Reardon and Frank H. Morgan.

The committee in charge of the affair was composed of Clement T. Dame, Walter H. Danforth and W. C. Quinby, and it was to their untiring efforts that the chief success of the event was largely due.

A Plumbing Goods Catalogue.

Catalogue No. 60, issued by the Rumsey & Sikemeier Company of 19 Pine street, St. Louis, Mo., is devoted to plumbers' and steam fitters' goods. In the opening pages are given half tone engravings of fine bath rooms, the equipment of which includes foot, sitz and shower baths, enameled bath tubs, and handsome lavatories with towel brackets, linen baskets, soap and sponge holders, and other bathroom equipments. The next 25 pages of the catalogue are devoted to steel clad and enameled bath tubs and enameled porcelain lined cast iron tubs of both French and Roman pattern, with a variety of styles of roll rim, both wide and narrow, foot and sitz baths. Shower baths, from the ring shower, head shower and ordinary douche, to the complete needle bath, occupy another section. A variety of styles of laundry tubs are shown in enameled cast iron, stone and solid porcelain, followed by an extensive line of kitchen and laundry sinks and slop sinks, made of all the usual materials, together with a wide assortment of fine enameled iron, solid porcelain and marble lavatories and sectional lavatories adapted for public buildings. Urinals and urinal stalls form another portion of the catalogue, together with water closets of the wash out, wash down and siphon jet type, with both high and low down flushing tanks, and without tanks to be flushed directly from the service pipe by means of a special valve. The catalogue also includes a line of wash out range water closets and frost proof closets. The Richmond boilers,

both sectional and round, for steam and hot water heating, are followed by an extensive line of direct and indirect radiators, steam traps and other specialties for steam fitters. The catalogue consists of 150 pages and has a well arranged index. It is bound in a red cloth cover.

Outing of Bronx Plumbers.

The Bronx Branch of the New York City Master Plumbers' Association gave their first annual outing last Thursday at Lohbauer's Park, Throgg's Neck, and it was a success in every way. The weather in the morning was not all that could be desired and at noon there was a terrific thunder and hail storm, the hailstones being as large as the proverbial egg and making all hands seek cover. The storm over, however, the games began.

Florence Stolz won the swimming race, as he could keep afloat with the least exertion. The ball game was won by the plumbers with a score of 20 to 15 by the supply men. Owing to the storm and the subsequent absence of wind the boat race was not a success. The running race of 100 yards was won by Joseph Carr, the plumbers' blacksmith. The three-legged race of 100 yards was won easily by Delaney and McEvily.

Among those present were Jos. Lewis of the City Department of Water Supply; Frank E. Moore of the Bureau of Buildings; Michael Hecht, superintendent of the Bureau of Public Buildings, and representatives from the other city departments. The supply trade was represented by the following concerns: Dimock & Fink Company, the Standard Plumbing Supply Company, the Metropolitan Supply Company, Richardson & Boynton Company, G. B. Raymond, J. A. Murray, Henry Huber Company, the E. S. Wheeler Company, Essex Bros. and others. Among the master plumbers present were Fred. Steiger, Salzman & Freitag, H. Rudolph, Lawrence McCann, J. P. Muller, D. L. Delaney, J. W. Sweeney, J. J. McManus, J. V. McEvily, D. Durie, Jr., Peter Schweickert, J. F. Hogan, Wm. Clark, Florence Stolz, Martin Klett, Ozab & Muller and others.

Brooklyn Master Plumbers' Outing.

Chairman E. Macdonald of the Entertainment Committee of the Brooklyn Branch of the Association of Master Plumbers of the city of New York, has favored *The Metal Worker* with a complimentary ticket for the annual outing of the association, which will be held at Donnelly's Grove, College Point, N. Y., on Wednesday, July 23. The steamer will leave the Bridge Dock at Fulton Ferry at 9 o'clock sharp. Music for the outing will be furnished by Professor Lent. The notice sent out to the members states that the association has reason to be proud of the character of their outings in the past, and though a right, royal good time has been the order of the day, a single incident has never occurred which would mar the pleasure of an individual. The members are invited to lay aside their cares on that day, bring the ladies and children and enjoy the outing. Tickets for adults are \$3, and for children 75 cents, which includes everything that will be required for the day. The tickets have a coupon for breakfast, to be served on arrival at the grove, and another for the dinner, to be served late in the afternoon. The Entertainment Committee is composed of E. Macdonald, William M. Brown, William Eiermann, S. J. Corcoran, Lewis Deiser and George W. Smyth. Those desiring tickets can secure them from E. Macdonald, 98 Cedar street, Brooklyn, N. Y.

The success of last year's outing of the Master Plumbers' Association of Jersey City, N. J., has led to the appointment of the following committee to make arrangements to repeat the trolley ride on Saturday afternoon, August 23: J. J. Ivans, chairman; W. J. Cross, Valentine J. Werner, Thomas J. Heatherton, George W. Knoll and J. M. Doran. Cars will leave the Pennsylvania Ferry at 2 o'clock for Wagner's Washington Park, Carlstadt, N. J., where Boket's Band will enliven the festivities.

Old Sanitary Theories Assailed.

William T. Sedgwick, professor of biology and lecturer on sanitary science and the public health in the Massachusetts Institute of Technology, and at one time biologist to the Board of Health of that State, says the *Chicago Tribune*, has recently published a work on sanitary science in which he not only upsets many popular beliefs, but takes direct issue with many scientific theories which have come to be accepted as law and gospel.

Professor Sedgwick thinks that the danger of sickness from the emanation of gases from sewers, drains, cesspools, &c., is greatly exaggerated. The air in sewers being unusually quiet, he claims it is comparatively free from bacteria. Stagnant sewage as found in cesspools is more dangerous, but even this he does not believe produces specific diseases, such as typhoid fever and diphtheria. He finds no connection between broken drains and epidemics, and says on this point "it is difficult to understand how the accumulation of sewage in a cellar or leakages of sewage from broken drains, or the escape of gases from such drains, can possibly provoke infectious diseases." He says: "The gases may by their toxic effect lower vital resistance and increase susceptibility, and probably their responsibility stops there." He also repudiates the noxious effects of bad smells and quotes in defense of his theory the most famous stench on record—that of the Thames in 1858 and 1859, which broke up Parliament and the law courts, stopped all steamer traffic on the river and drove the Londoners from the bridges. Yet during the time of its prevalence there was a notably low death rate and a diminution in all the diseases popularly attributed to stench.

Furthermore, Professor Sedgwick relieves the atmosphere of much responsibility for the propagation of certain diseases. He takes no stock in late springs, hard winters, newly turned up soil or prolonged cloudy weather as producers of disease. He does not believe in the unwholesomeness of damp cellars. He prefers old water to fresh water, because in the former the harmful bacteria have had time to die out, and claims that river water is less dangerous when the river is low than during freshets. He states the paradox that "whenever water is freshest it may be least safe; and when rich in sewage it is not necessarily more dangerous."

Professor Sedgwick runs counter to nearly all the accepted theories of sanitary science, and this brings up the old question: When the doctors disagree, what are you going to do? Perhaps it might be better to go along and pay no attention to any of them, as our grandfathers used to do—and they were fairly healthy. And yet there is a compensatory side to Professor Sedgwick's negations, as stated by the Springfield (Mass.) *Republican* in a long review of his book: "The terrors of civilization are getting to be oppressive and one might about as well contract a disease as live in constant fear of it. Cleanliness is an excellent virtue, but it is not necessary to be frightened to death by a little dirt. Professor Sedgwick is considerate enough to drive away a good many of the bogies."

Heating and Plumbing Notes.

THE strike in the plumbing trade, which has been in existence for several weeks at Toronto, Canada, has been settled by an advance in wages of 2½ cents per hour, with a further advance to take effect January 1, 1903. The wages will be 32 cents per hour. The plumbers struck for 37½ cents per hour.

THE ROYAL STEAM HEATER COMPANY of Gardner, Mass., have secured the contract for heating a school building and will use one of the American Sectional Boilers, made by the Pierce, Butler & Pierce Mfg. Company, Syracuse, N. Y.

THE Board of Examining Plumbers of Bridgeport, Conn., consists of A. L. McGrath, president; Building Inspector Rowland, secretary, and W. S. Hurlburt, Andrew Owens and Joseph Mullins.

CAHILL & SMITH, Pittsfield, Mass., have a \$2000 plumbing contract for a new house at Chatham, N. Y.

A FIRE which visited the Acadia Mines, at Truro, Nova Scotia, on July 7, swept away the plant of the Montreal Pipe Foundry Company, located near the mine. All of the buildings, with the exception of the machine shop, were old. The loss is estimated at \$25,000, and is fully covered by insurance.

A FIRE visited the plumbing establishment of M. B. Jordan, at Bangor, Maine, last week. Mr. Jordan suc-

ceeded in removing the majority of his stock from the building, and his loss was comparatively small.

THE NEW YORK PLUMBING COMPANY, of Omaha, Neb., who have the contract for furnishing the material and doing the plumbing for the new St. Bernard Hospital, erected by the Sisters of Mercy in that city, have had their men go out on strike, because the sisters have in their employ a nonunion plumber, who they insisted should aid in the new plumbing work in the new hospital. The sisters have relieved the New York Plumbing Company of the obligation to do the work, providing they continue to furnish the material, they securing the workmen to install it. The sisters seem to have no trouble in securing the necessary workmen, and on the refusal of the New York Plumbing Company to stop supplying the material, their workmen, under orders from the Omaha Union, have quit work.

SALT & ALLMON, Melrose, Mass., have secured the contract for plumbing the new electric light plant at Woburn. They also have a large contract for plumbing work at Charlestown.

THE CARLTON HARDWARE COMPANY, Calumet, Mich., have the contract for plumbing and heating a new house for Carl Nystrom.

At a meeting of the Wilkes-Barre Heat, Light & Motor Company, Wilkes-Barre, Pa., on July 10, it was voted to notify customers of the company that the rates for steam would be advanced 20 per cent., owing to the increased cost of manufacture.

THE Schoolhouse Commissioners of the city of Boston, Mass., will receive bids until July 28 for heating and plumbing the primary school building at Westville street, Dorchester.

A LITTLE PAMPHLET from the Abendroth & Root Mfg. Company, 99 John street, New York, gives notice of the resumption of their business, after the fire which destroyed their plant in Brooklyn, in a new plant at Newburgh, N. Y., where they are prepared to furnish the Root Boilers and the Spiral Riveted Pipes and Fittings formerly made by them. The company now enjoy excellent facilities for handling large work promptly, and also new branches of foundry and machine work.

THE NOVELTY IRON COMPANY, Canton, Ohio, are sending to the trade two interesting pieces of trade literature. One is a catalogue of 36 pages, devoted to the Our Own line of Steam and Hot Water Heaters. The catalogue opens with Tank Heaters and Heaters of larger capacity of both round and square form. Both horizontal and vertical sectional constructions are shown adapted for steam and hot water; also the Canton Radiators, which are made in two and three columns in all the different heights. The second catalogue is entitled "Our Own Steam Fitters' Handbook," and in addition to giving the extensive line of Boilers made by the house it includes a number of specialties required by steam fitters, including Radiator Valves, Pipe Hangers, Expansion Tanks, &c. This catalogue also contains a variety of tables and other useful information.

THE HARRISBURG PIPE & PIPE BENDING WORKS, Harrisburg, Pa., are building six furnaces for the heating of billets which will be used in the rolling mill being constructed for the company. All the product of the furnaces will be used in the works. Work on the new departments is being rapidly pushed and the buildings will be completed in a short time.

THE LUNKENHEIMER COMPANY have recently purchased a large number of Westinghouse induction motors for the equipment of their new works at Cincinnati, Ohio.

BALDWIN & PENNINGTON, Baltimore, Md., are preparing plans for a central heating plant for the State buildings at Annapolis, Md., to cost \$150,000.

CONTRACTS have been let for the new buildings of the Krein Company, who will establish a factory at Wapakoneta, Ohio, for the manufacture of Acetylene Gas Generators.

THE MUELLER MFG. COMPANY of Decatur, Ill., are erecting a new warehouse and office building. They manufacture Water and Gas Specialties.

RUMSEY & Co., Seneca Falls, N. Y., are sending out the fifty-third edition of their illustrated catalogue devoted to Hand and Power Pumps and Hydraulic and Pumping Machinery for all purposes. Among the new and improved goods shown are Double Acting Force Pumps, Wind Mill Double Acting Force Pumps; Deep Well Working Heads, Brass Soda Water Pressure Pumps, &c. The catalogue is well printed and contains more than 250 pages.

THE GLEASON, BAILEY & SCIPLE MFG. COMPANY, Seneca Falls, N. Y., issue a circular showing Brass Double Cylinder Force Pumps and Double Acting Suction and Force Pumps. Also a catalogue of Fittings for steam and hot water, of standard gas pipe sizes, which shows these goods made with a cast thread by a patent process owned and controlled by the company.

THE COLWELL LEAD COMPANY, 51 to 65 Centre street, New York, announce that they will close their stores and offices at 5 p.m. during the months of July and August. This concern also close at 1 p.m. on Saturdays during the summer months. It is said that there is not sufficient business transacted after 5 o'clock to warrant keeping open in the summer, and during the hot spell the extra half hour given to the employees will be appreciated and better results to the firm will be the effect.

JAMES B. CLOW & SONS, Chicago, Ill., are sending out three circulars that will be of interest to plumbers and steam fitters, one devoted to the Clow Portable Pipe Machine for cutting and threading Pipe by hand power in all sizes up to 3 inches, while by means of belt power 4-inch Pipe can be cut. Another circular is devoted to the Climax Coupling for ammonia fittings, adapted for breweries, ice plants, cold storage plants and such work. The third circular is devoted to the Clow Triumph Water Heaters, made in eight different sizes, having a capacity from 150 to 900 gallons of water per hour.

New Firms and Changes.

CASEY & SHERMAN are a new firm who will engage in the manufacture of Boilers in Chattanooga, Tenn. Mr. Casey was with the Casey & Hedges Mfg. Company for a number of years as their foreman, and Mr. Sherman was a traveling salesman for the same house. They are building a new plant and have purchased most of the machinery for its equipment.

THE BALTIMORE REFRIGERATING & HEATING COMPANY, Baltimore, Md., who were incorporated last week with a capital of \$1,000,000, having recently received a franchise, intend to issue \$2,000,000 in bonds. The company have headquarters at 105 Smith street. The president is R. B. Fentress of Norfolk, vice-president, S. B. Medairy; secretary, John F. Sippel; general manager, L. M. Tough. They have purchased a large cold storage warehouse and plant, which is now being extensively enlarged and improved, and will be equipped with boilers of 4000 horse-power and refrigerating machinery with 700 tons capacity. The company intend to supply the general trade through underground subways.

SEABORN & DEAN, plumbers and tinsmiths at Fort Fairfield, Maine, have removed their business to a shop at the foot of Hacker Hill.

THE UNITED STATES COUPLING & SUPPLY COMPANY of Gardiner, Maine, have been incorporated with a capital of \$100,000 for making and selling all kinds of Tools, Machinery, Hose, &c. The officers are: President, H. E. Robinson, Gardiner, Maine, and treasurer, E. L. Portti. Boothbay Harbor, Maine.

THE AMERICAN VALVE & METER COMPANY of Cincinnati, Ohio, have been incorporated with \$33,000 capital for the purpose of engaging in the manufacture of Meters. N. P. Tenner, Jr., William Porter, F. M. Foster, D. S. Marfield and C. E. Prior, all of Cincinnati, are the incorporators.

AT Frankfort, Ind., a company with a capital of \$25,000 are being organized to engage in the manufacture of Brass Goods, including Steam Fittings, &c. Those interested are D. A. Coulter, G. T. Dinwiddie, J. H. Coulter, W. H. Coulter, J. McClamroch, F. S. Coulter,

H. C. Sheridan, J. B. Meifeld, J. P. Given, H. F. Campbell and C. C. McFann.

GIBSON BROS. are successors to J. C. Gibson in the Agricultural Implement, Pump and Wind Mill business in Maxwell, Iowa.

E. R. TUTT, after 15 years' activity, has disposed of his Hardware, Stove, Plumbing and Heating business in Oakland, Cal., to the Ingram Hardware Company, comprising Wm. Ingram, Wm. McCaslin and John S. Gallagher. Mr. Ingram was formerly a member of the Schaw, Ingram & Batcher Company of Sacramento, where he has been located for a period of 30 years. The present commodious store at 511 and 513 Thirteenth street is to be renovated throughout. Mr. Tutt's headquarters will hereafter be in San Francisco, where he will do contract plumbing exclusively.

THE FIDELITY POTTERY COMPANY of Trenton, N. J., organized with Charles H. Barker as president and J. H. Cogill as secretary and treasurer, have purchased the plant formerly operated by the Egyptian Pottery Company and will continue under an entirely new management the manufacture of Sanitary Earthen Ware.

THE NATIONAL HYDRO CARBON GAS COMPANY of Bangor, Maine, have been incorporated with a capital of \$500,000 for producing, distributing, leasing and selling apparatus for lighting and heating purposes. The officers are: President, H. M. Cook, and treasurer, A. Fontaine, both of Bangor, Maine.

The No. 33 Gasoline Torch.

The newest production in the line of gasoline torches brought out by the Clayton & Lambert Mfg. Company, Detroit, Mich., is known as the No. 33 torch, of which

The No. 33 Gasoline Torch.

an illustration is given herewith. This torch is claimed by the manufacturers to be constructed on the best and most scientific principles and of the highest grade of materials. They recommend it as especially adapted for inside wiring, removing the putty from sashes, light brazing and many other kinds of work done by mechanics. The torch is light, self contained and can be carried in the pocket, and it is ready for use instantly, simply needing a match to light it. The tank is supplied with a dome so that air pressure can be applied, making a blue blast flame, which, while small, and running to a fine point, is intensely hot. The burner hangs on a swivel, so that the flame can be thrown in any direction. The makers point out that it is a powerful generator, consuming but little gasoline, and declare that it will save the user its cost in a short time. The catalogue published by the firm covering their gasoline fire pots and torches will be sent to any one interested in these goods upon application.

The June number of the *Iowa Engineer*, published by the Iowa State College, Ames, Iowa, will be of interest to those who desire to study the value of the different fuels of that State.

THE SHEET TRADE.

The first half of 1902 was an exceedingly active season in the sheet trade. Notwithstanding the entrance into the market of quite a number of independent mills the demand for black and galvanized sheets was constantly ahead of the producing capacity, and it has been only in the past few weeks that any let up has occurred and the mills have been enabled to make deliveries in anything like a reasonable time. While the advent of summer has brought with it some falling off in the demand for sheets, most of the mills, both in and outside of the combination, are still busy on orders, some of them with enough business on their books to keep them well occupied until the fall. A few of them now have been shut down for the purpose of undergoing the repairs and overhauling made necessary by a year's full and steady operation. There is little doubt that the past six months have been a remarkably profitable period for the manufacturers, as prices have been steadily maintained at a remunerative level, and they have had all the business they could handle. In fact many mills have been forced to turn down orders from want of ability to fill them within a reasonable period. The consumption of sheets this year must have been extraordinarily heavy for the large bulk of the material purchased seems to have gone directly into use. Stocks in jobber's hands have never been large and are still below the average. Some of the new independent sheet mills have been hampered in their operations by the difficulty in securing a sufficient supply of steel. Consequently they have not been able to run to the measure of their capacity, as have the plants of the American Sheet Steel Company. Some of these new concerns, however, who own their own steel plants have been able to make sheets and put them on the market in competition with the leading interest. Before the end of the year several more large modern mills will be completed by companies outside of the combination, when it seems that the producing capacity is likely to outstrip the demand, with the result that usually follows—namely, sharp competition and falling prices. The strength of the iron market, however, will probably tend to prevent any material decline in the price of sheets for some time to come.

CORRECT THE FORMULA.

An error crept into one of the "Formulas for Determining the Capacities of Vessels," given in the last issue of *The Metal Worker*, and as the contributor, F. W. Rudd, desires that no one shall suffer any inconvenience from it, we give the correct formula, as follows:

"Volume in gallons is found in the following formula:

"For a cylinder.

"Volume equals $D^2h \times 0.0034 +$."

By reference to the sixteenth line from the bottom of page 50 of *The Metal Worker* of July 12 it will be found that one of the ciphers between the decimal point and the figure 3 was omitted. To use the formula without the correction would give a cylinder a tenfold greater capacity than it actually has.

The Amalgamated Association.

At the recent convention of the Amalgamated Association of Iron, Steel and Tin Workers, at Wheeling, W. Va., it was decided that the vice-presidents of the various districts should meet at Columbus, Ohio, at as early a date as practicable, to compare special scales and district rulings, with a view to making them as nearly uniform as possible. Thursday, July 17, was agreed upon between President Shaffer of the Amalgamated Association and James H. Nutt of the Republic Iron & Steel Company as the date on which all the vice-presidents would meet in conference. In addition to the work assigned to it by the convention the meeting will also arrange the scale for plate mills. The meeting is an unique one in the history of the Amalgamated Association, nothing of the kind ever having been done

before. It was made necessary on account of the differences in various scales for special mills, which the association believes should be made more uniform.

PATTERN FOR SCALE SCOOP.

(Without allowance for laps).

A tinsmith is sometimes called upon to make a scale scoop of tin or polished brass. A finished view of such an article is shown in Fig. 1, where the top edge is wired and the joint either seamed or soldered. While the pattern can be obtained by the cone or radial line method a simpler rule is shown in Fig. 2, by which the pattern is developed by means of the parallel line method.

First draw the elevation of the scoop, as shown by A B C D. In practice one half elevation is all that is re-

Pattern for Scale Scoop.—Fig. 1.—Perspective View.

quired. From the point B, at right angles to D C, draw the line B E, on which line a true section must be obtained, as follows: Extend the line D C as D F. Parallel to D F, and from B draw the line B G. At any point, as H, at right angles to B G, draw the line H I, which represents the depth of the scoop. At pleasure establish the width of the scoop at the top, as shown by K and L. Draw a line from K to I, which bisect and obtain the point T. From T, at right angles to K I, draw a line intersecting the center line H I at J. With J as center and J K as radius describe the arc K I L, which represents the true section on the line B E in the elevation.

Divide the section into equal parts, as shown by the small figures 1 to 4 to 1, through which, parallel to G B,

Fig. 2.—Elevation, Section and Pattern.

draw lines into the elevation, intersecting the lines B C and B D at points 1 to 4, as shown. Now, at right angles to D C draw the stretchout line M N, upon which place the stretchout of the true section, as shown by points 1 to 4 to 1 on M N; through which, at right angles to M N, draw lines, which intersect with lines drawn at right angles to D C from similar numbered intersections on B C and C D. A line traced through the points thus obtained, as shown by M O N P, will be the half pattern of the scale scoop. Allowance must be made for wiring and seaming.

THE TIN PLATE TRADE.

Replying to misleading reports circulated during the last week, W. T. Graham, president of the American Tin Plate Company, issued the following statement:

Reports published in this week's daily and trade papers representing that a cut in wages is contemplated by the American Tin Plate Company are absolutely untrue. The American Tin Plate Company have no difference with the Amalgamated Association of Iron and Steel Workers, and mutual feelings of satisfaction and friendliness between the company and all their workmen were never more pronounced than they are at the present time. The time of the recent conference between the company and the Amalgamated Association was entirely given to consideration of a question of mutual interest, and reached an agreement as to the course that would be advantageous to both. This question was one requiring decision by the several lodges of the association, and is now recommended to them for favorable action by the officers and all the members of the association's Conference Committee.

Soldering a Strainer on a Well Pipe.

The evidence that the "know how" is an important factor in deriving profit from work is clearly manifest in the method adopted by John Le Sauvage of Duane street, New York, who was employed by a customer to solder a perforated brass wire strainer over a 10-foot length of 6-inch galvanized iron pipe, which was perforated with some 180 holes of $1\frac{1}{4}$ inch diameter. This would be a tedious job if heavy and hot coppers alone were depended upon for getting up sufficient heat in the thick iron pipe to make the solder adhere strongly to it. The perforated wire was in sections 14 inches long, and in addition to the seams where the ends met the brass had to be soldered to the pipe at each end throughout the entire circumference. In order to expedite matters two fire pots were used, one for heating the soldering coppers, while the other fire pot was placed immediately under the pipe, which was supported conveniently for the purpose. By this means the heat of the fire pot heated up the pipe so that comparatively small coppers were capable of soaking the solder into the sections so as to make a substantial and durable job. To have soldered the brass strainers to this pipe without the aid of the extra fire pot would have consumed considerable time. Various tinsmiths, who were asked for an opinion as to the time that would be required, asserted that from three to four times the amount of time that was actually taken would be necessary to make a successful job. None of them considered the use of the extra fire pot as a time and labor saver.

Canton Metal Ceilings and Side Walls.

We are indebted to the Canton Steel Roofing Company, Canton, Ohio, for a copy of their metal ceiling catalogue F, recently published. The book is of the usual oblong shape, 10 x 13 inches in size, and is composed of 112 pages, illustrated with exceptionally good half-tone engravings. It is devoted exclusively to ornamental steel ceilings and side walls, of which a large variety of handsome designs are presented in the work. Directions for ordering and applying the company's continuous metal ceilings are a useful feature of the catalogue. The styles in which the ceilings are made embrace Romanesque, German Renaissance, Empire, Colonial, Gothic and Rococo. The illustrations include ceiling and side wall plates, borders, coves, moldings, center pieces, wainscoting, foot moldings and cornices, ventilated centers and various kinds of ornaments, all of which are stamped from sheet steel. Two sets of plates showing profiles of cornices and moldings and of beam or girder covering in various styles, with dimensions, give a good idea of the possibilities of sheet metal ornamentation in interior finish. The company also manufacture stamped metal emblems for churches and meeting places of fraternal societies. A price-list applying to catalogue F accompanies the book.

TIN PLATE FOR EXPORT?

A special to the New York Times from Pittsburgh, dated July 17, says: The vote now being taken by the Amalgamated Association of Iron, Steel and Tin Workers will probably result in the acceptance of the change of agreement asked by the American Tin Plate Company, one of which is that the men in some of the mills accept a reduction of 25 per cent. on labor entering into the manufacture of tin plate for export. There is some doubt as to what the attitude of independent tin plate mills will be.

A proposition was formulated which is now being considered by the tin workers, providing for a 25 per cent. reduction on all labor entering into export tin plates. The association is advised that if its members accept this reduction the American Tin Plate Company will immediately receive orders for about 1,500,000 boxes of tin plate per year, which is now supplied from abroad. The wage scale on domestic tin plate will remain the same and the price of the material consumed in this country will also remain unchanged. By the reduction in wages the American Tin Plate Company will be in a position to meet the prices of the foreign mills.

COOLING A ROOF.

BY D. S.

Some readers of *The Metal Worker* probably will be interested in the method I adopted for satisfying a customer who desired to have the part of a building immediately under the tin roof made cooler, owing to the illness of the occupant of one of the rooms. Between the ceiling of the room and the roof was a small air space, which is quite generally provided in the construction of buildings, but it was insufficient to prevent the heat of the roof making itself very perceptible in the chamber beneath. As the work had to be done quickly and without any damage to the roof already in place, a makeshift was resorted to. I purchased some thick, soft, open texture wrapping paper, covering the roof with six thicknesses of this material. Above this I laid 1-inch boards about a foot or so apart, and on the top of these two more thicknesses of the soft paper. On top of this again I laid 1-inch boards close together and weighted them so as to prevent any danger of their being blown off. I then arranged for connecting a hose with the house water supply at the highest point in the building so that the entire roof could be wet down to further counteract the heat of the sun. The effect not only reduced the temperature of the room several degrees, but also produced a benefit that satisfied my customer and had a substantial influence upon the convalescence of the patient.

Roofing Materials Catalogue.

The Galesburg Cornice Works, Galesburg, Ill., are sending out a 32-page illustrated catalogue and price-list of the architectural sheet metal goods and sheet metal specialties which they manufacture. Among the goods shown are molded face roof gutters, galvanized steel eave trough, miters, eave trough ends, corrugated conductor pipe, galvanized elbows and shoes, galvanized steel gutters, cut offs and strainers, wire conductor hooks, eave trough hangers, ridge roll, ridge cresting, V ridge cap and the adjustable hip shingle, together with finials and vanes in large variety, also the Galesburg skylights, recently illustrated and described in these columns. The firm are also large jobbers of tin andterne plates, galvanized steel sheets, furnace pipe and fittings, hot air registers, solder, sheet zinc, elastic roofing cement, asbestos furnace cement and asbestos paper for hot air or steam pipes. The last few pages of the publication are devoted to tables of sizes and weights of various roof coverings, also directions for obtaining diameters, circumferences and areas, and a table of relative value of nonconducting materials, with approximate weights of various roof coverings and skylight glass, also one of weights of galvanized iron. The publication will be found a useful work of reference for those engaged in the roofing trade.

FLASHINGS.

L. M. Ekin has been appointed secretary of the Huntington Tin & Planished Plate Company of Huntington, W. Va.

THE growing scarcity of cedar wood, of which cigar boxes are usually made, has suggested the use of Tin Plate for the manufacture of these boxes as a substitute for the cedar wood. It is reported that already some cigar boxes have been made from Tin, which have proved very serviceable packages. This departure, if widely followed, will open up a large new field for the use of Tin Plate.

THE LAUGHLIN TIN PLATE PLANT, at Wheeling, W. Va., was closed down on Monday for ten days for the purpose of overhauling and making certain necessary repairs.

EXPERIMENTS are being carried out at the works of the Berger Mfg. Company, Canton, Ohio, for the production of Enameled Metal Shingles for roofing purposes. Some of these Metallic Shingles have already been turned out and are regarded as very satisfactory. The manufacturers believe they can produce and sell them cheaper than Slate.

THE R. R. MABIE ROOFING COMPANY of New York City have been incorporated with a capital of \$25,000 by R. R. Mabie, George Baum and O. A. Samuel.

M. J. HYLAND, Middletown, Conn., has the roofing of the new factory which is being erected at South Farms by the New England Enameling Company.

It is reported that the erection of a ten-mill Sheet Steel plant will be begun at Apollo, Pa., this summer. The industry, it is said, will be backed by Pittsburgh and Apollo capitalists who are experienced men in the Sheet manufacturing industry. The plant will be built in the most modern manner, and equipped to turn out the finished product from the raw material. A tract of 5 acres lying between the river and the railroad has been selected as the site of the new plant.

THE HUMBERT TIN PLATE WORKS of the American Tin Plate Company, at South Connellsville, Pa., have been closed down for three or four weeks for the purpose of repairs and overhauling.

THE new plant of the Jackson Iron & Tin Plate Company, at Clarksburg, W. Va., which has just been completed at a cost of \$500,000, is starting off under the most favorable auspices. The company already have a large volume of orders on their books, which will suffice to keep the works busy for many weeks to come.

THE LION TIN PLATE WORKS, at Nantyglo, Monmouthshire, England, consisting of eight mills, are to be offered for sale at public auction.

THE LA BELLE plant of the American Tin Plate Company, at Wheeling, W. Va., consisting of ten mills, has been closed down for its usual summer overhauling. All the old furnaces which have been torn down are being rebuilt, and a number of other improvements and repairs are being carried out during the shut down.

At the bimonthly settlement of the Sheet and Tin Plate scales at Pittsburgh last week it was found that the average prices of shipments of Sheets and Tin Plate in May and June did not warrant any advance in wages to the men in July and August. At the bimonthly settlement of the Bar Iron scale in Youngstown, Ohio, last week it was found that the average prices of shipments of Iron Bars in May and June warranted an advance of 25 cents to puddlers and 2 cents to finishers for July and August. Puddlers are now being paid \$6 a ton, the highest wage for many years.

It is reported that the American Sheet Steel Company have placed a contract with Kelley, Walker & O'Neil for putting in 20 new gas wells in the fields surrounding Indianapolis. The gas plant at Muncie is very much in need of a larger gas supply, and it is said that the company will not be able to operate this coming winter if the supply is not increased. They have a pumping station at Bethel, but the supply is inadequate to meet their requirements. The contract for the wells is estimated at about \$20,000.

THE new Tin Plate plant of the Pope Tin Plate Company, at Steubenville, Ohio, has been partially started, 7 of the 12 mills now running on Black Plate. The other five mills will be started in about a month. This is said to be one of the best equipped Tin mills ever built, the mills and engines being extremely heavy.

GEO. E. DAY has been appointed secretary and general sales agent of the Youngstown Iron, Sheet & Tube Company, succeeding W. H. Foster.

THE retirement is announced of Col. George D. Wick from the presidency of the Youngstown Iron, Sheet & Tube Company of Youngstown, Ohio. Colonel Wick, who is in Europe, retires on account of his health. The stockholders of the company will meet next week to elect his successor.

REPAIRS are about completed at the New Castle, Pa., plant of the American Tin Plate Company. The mills there will shortly resume operations.

IN addition to those reported in our issue last week, the following named concerns have signed the Amalgamated Association scale: American Rolling Mill Company, Middletown, Ohio; Ewald Iron Company, Louisville, Ky.; Washington Charcoal Iron & Tin Mills, Washington, Pa.; Parkersburg Iron & Steel Company, Parkersburg, W. Va.; Republic Works of the National Tube Company, Pittsburgh, Pa.; Kittanning Iron & Steel Mfg. Company, Kittanning, Pa.; Tuscora Steel Company, Newcomerstown, Ohio; South Sharon Tin Plate Mill, South Sharon, Pa.; Waukesha Sheet Steel Company, Waukesha, Wis.

Proposed Bar Mill Consolidation Abandoned.

THE active competition which has resulted in the sale of bar iron under 1.75 cents has been the motive for a determined effort to consolidate most of the independent bar iron mills in the Central West. A company was projected recently with a proposed capital of \$6,000,000 to embrace nine of the leading bar mills in the section named. It is claimed that with the best mill practice, the present prices of scrap and bar iron would allow no profit. In fact, there would be an actual loss in selling bar iron at 1.75 cents and under. It was hoped that by consolidating the mills referred to, better control of the market could be exercised, and sales of the finished iron be made only on a profitable basis. Therefusal of some of the leading mills to enter the proposed combine, however, caused the abandonment of the plan this week, and it is thought that no further effort will be made to bring about a consolidation. Possibly, some agreement as to selling prices may result from the agitation.

THE ROBERTSON MFG. COMPANY, 203 West Utica street, Buffalo, N. Y., are sending to the trade a little pamphlet showing illustrations of the various styles of the Hero Grinder, adapted for foot or hand power, or for belt connection to power apparatus. The various Grinders are adapted for sharpening tools, skates, for family use, and for sharpening mowing machine knives. The catalogue also shows the Hercules Tap Wrench and Robertson's New Sensitive Bench Plane. Two pages are devoted to the Robertson Germ Proof Automatic Cleaning Filter, a new device that can be thoroughly cleansed, by simply reversing the flow of water through it. Other goods presented are the Eclipse Horse Singer and the Reizal Gas and Gasolene Engines.

SIDNEY SHEPARD & Co. of Buffalo have filed plans for the erection of a \$45,000 building in Buffalo, where the company now have two plants. The company manufacture Sheet Iron Goods. The new building will be a six-story structure, and it is understood the company's business will be concentrated in it on completion.

THE UNITED STATES ASBESTOS COMPANY of Portland, Maine, have been incorporated, with a capital stock of \$500,000, to mine and deal in Asbestos in all its forms. The officers of the company are: G. S. Jones, Boston, Mass., president, and J. C. Wood, Portland, Maine, treasurer.

THE LETTER BOX.

Inquiries in regard to practical questions of general interest are invited, in reply to which we shall be glad to receive suggestions and information from our readers.

Correspondents are requested in all cases to give their names and addresses, which will not, however, be published or disclosed without their consent.

PATTERN FOR ROUND FLUTED FINIAL TOP.

From G. A. B., Redlands, Cal.—Will you please let me know, through the columns of *The Metal Worker*, how to obtain the patterns and construct the finial top,

center in plan, draw the horizontal line D E, upon which place the stretchout of the section 1 7, as shown by similar figures on E D, through which, at right angles to E D, draw lines which intersect with lines drawn parallel to D E from intersections on the miter lines *a* and *b*. Trace a line through the points thus obtained, as shown by F G H, which will be the pattern for one of the body sides. These sides should be soldered together, and the neck B in section attached to it.

This part or body being completed, the raising work which follows depends more upon the skill of the workman than upon the patterns, which are merely flat strips of metal which are raised or stretched to the desired shape. The practical method for obtaining these bead patterns is as follows: For the small bead A, a flat strip

Fig. 1.—Reproduction of Correspondent's Sketch.

Fig. 2.—Plan, Section and Pattern.

PATTERN FOR ROUND FLUTED FINIAL TOP.

a sketch of which I send herewith? I have two of them to make, and should like some help on them.

Answer.—In Fig. 1 is shown a reduced view of our correspondent's sketch, which shows a circular finial top, the neck of which is 3 inches in diameter, the height 12 inches and the diameter at its widest point 6 inches. In this connection it may be proper to remark that these tops can be bought ready made from zinc ornament manufacturers and are turned out in various sizes. We presume, however, that our correspondent knows this, but wants to know how to construct one by hand.

These tops are usually stamped by machine in two halves and are made of zinc or copper, having no body on the inside. In making these tops by hand, a body is first constructed around which the small beads are drawn in spiral shape, as shown.

In Fig. 2, let 1 7 7' represent a section of the body and C the plan of the same placed in its proper position, as shown by the center line I J. In this case, the plan has been divided into an octagon; in practice more spaces should be employed which will bring the body nearer to a true circle. Divide the half section 1 7 into equal parts, as shown from 1 to 7. From these points drop vertical lines intersecting the two miter lines drawn from the corners *a* and *b* to the center. From the

of metal is used, in width equal to the stretchout of the bead and in length equal to the amount required for the circumference of the 3-inch neck. If a larger bead were required for a larger top, the bead A would have to be made in two flaring sections with the seam at *c*.

For the patterns for the beads, forming a spiral over the body, as shown in Fig. 1, it is usual to use a piece of crayon and mark the width and pitch of the beads on the body, after which strips of paper are cut which will wind around the body following the crayon lines on the body, and adding to either side of the center line on the paper the amount it would require to hammer up the bead. Then the beads are hammered to the required shape, drawing them around the corners of the body, as shown by *h i* in plan, and *d e f* in section, in Fig. 2. As before mentioned, much depends on what skill the workman has with the hammer.

COPPER FOR SMOKE PIPE.

From I. M. J., Baltimore, Md.—In reply to the inquiry of "W. J." in *The Metal Worker* of July 12, I would say I do not know anything about the durability of copper smoke pipe, but I do know a good deal about the durability of copper reservoirs in cooking stoves, which have been largely used in the country districts

of the South. Where these reservoirs have been made of sufficiently thick copper they wear out from the inside rather than corrode through from the outside. The conditions here are frequently a reservoir full of cold water, sometimes a wood fire and sometimes a coal fire in the stove, and with the products of combustion thrown around the copper vessel or along one side for heating the water. The cold body of water is well calculated to induce the depositing of any of the injurious elements that the products of combustion may contain, and I should consider the conditions here much more detrimental to the lasting qualities of the copper than could be possibly produced in a pipe that would be located in the vent flue for carrying off the products of combustion and heating the flue so as to induce an inside draft for ventilating purposes.

From J. L. S., New York City.—Having read the inquiry of your correspondent, "W. J.," in *The Metal Worker* of July 12 in reference to the use of copper for smoke pipe, I would say that its durability and usefulness depend largely upon the weight of the copper used and the method of supporting it in the flue. I assume that the pipe would be of comparatively large diameter, in which case, in my opinion, copper of less weight than 20 ounces should not be used. If copper of sufficient weight is used and is supported so that it will not buckle, there will be little trouble from creosote or any of the other deposits from the products of combustion which must pass through it.

SOLDER COOLS ON BRASS.

From O. R. T., Waverley, Iowa.—I am a new beginner at joint wiping and would like to know why it is that I cannot wipe a joint on a brass soldering nipple. I can wipe a good joint in joining lead to lead, but when I try to wipe a joint connecting lead to a brass nipple the solder gets hard on the brass before I can wipe it. The lead end to the joint I can get all right, but the brass end I fail on. I would like to have *The Metal Worker* or some of its readers tell me the reason for my failure.

Answer.—The difficulty of wiping clean edges on joints with one or both ends of brass is experienced by every plumber and is very discouraging to the beginner, principally because he cannot form and wipe the joint quickly enough to be successful, even when everything has been done to counteract the cooling of the brass edges. Unequal conduction of heat is the base of the trouble, but is not always the specific cause of failure aside from lack of skill on the plumber's part. The conductivity of brass for heat is given as 0.24; lead, 0.09; tin, 0.15, when compared with silver as 1. Assuming the solder to be half and half wiping, and its conducting power 0.12, a mean of the tin and lead, with the lead at 0.09, the whole trouble appears to be the heat running on the brass. This may be true, but the heat is not always running into, along and away from the joint, for, in the case of extra heavy supply pipe being wiped onto a common brass solder nipple and the nipple held in place by a pine stick, there is no place for a great amount of heat to run. It cannot run off at the end beyond the rate of radiation and the loss of heat by radiation from the general surface of the nipple is too slow to account for the evident loss of heat in some manner. This loss is satisfactorily accounted for on the assumption that the heat runs back into the lead pipe out of the brass, causing the same effect on the edge of the joint as though the heat continued to be conducted away from the joint into brass.

This assumption apparently admits a paradox, because a slower conductor should prevent the heat running out of the brass. It would, if the area of contact was small, but there is the actual contact with the brass of the lead pipe capable of conducting the heat about one-third as fast as brass. This surface is more than quadrupled by the solder contact of the joint, with the conducting power of the mass of solder at about half that of brass, the solder being in contact with both the lead pipe and the brass and the area of the cross section of the pipe being much greater than that of the

brass. These conditions alone are amply sufficient to rob the brass of more heat than usually suspected, and when it is remembered that tinning by pouring wiping solder on leaves a tinning of almost pure tin on account of the tin giving up its heat readily and chilling in contact with the poorer conducting surface, it will be seen that the heat can be transferred to the pipe at a rate insuring trouble, even when the brass is short. When the brass end is long the heat is lost by conduction both ways.

Knowing what is to be contended with, it is easy to do all that can be done to help the wiper. The brass end should be pasted with paper to keep the heat from being taken up by the overlapping solder when forming the joint. The pasting need not be so wide as to interfere with solder being poured out on the brass to heat it while getting up the heat, but the surface outside of the pasting should be soiled if the brass is new. The lead must be soiled outside of the cleaning so that solder can be poured out on the pipe liberally. A mass of solder poured back on the lead a few inches from the joint helps to hold the heat in both edges of the joint. If the brass is a faucet, pour on the bibb end. This will steady the brass and feed heat toward the joint. If the brass is a stop cock prepare to wipe both ends at once, making half the heat or more on one end, then on the other, leaving a mass of solder on the second end. Next wipe the joint on the end first poured on, finishing the other end immediately before the first joint gets cold. If the joints are upright finish the upper one first. If the brass is a pipe of some length, pour a mass of solder out and along the pipe, beginning at least 2 inches from the joint. Pour heavily on the brass part of the cleaning. Let the solder mass and extend over the ends of the cleaning alternately. Pour down to the brass when working on the brass end. Take a full ladle of hot solder at the last, pour the mass down and replace it once or twice; then, with enough on the cloth and pipe together to make the joint, pour the brass end clean next to the pasting and pour over it until the ladle is nearly empty. Then finish pouring on the lead end. This takes about half a minute on ordinary joints. When ready to make the joint, form it before cutting the edges down with the cloth. Cut the edge on the lead end down first. Keep the hottest solder twisted over to the brass end when forming the joint. Wipe quickly. If these directions are followed little trouble should be encountered with the brass end of a joint.

The collapse of the famous Campanile at Venice is a most regrettable occurrence. This bell tower formed one of the most striking of the numerous monuments of antiquity in the Queen City of the Adriatic. The most unfortunate part of the thing, however, is that, in the opinion of scientific men, the fall of the tower is simply a forerunner of the ultimate destruction of many of the historic buildings in Venice. Professor Wagner, the city architect, believes that practically the whole of the city is doomed to destruction. He says that the subsoil has deteriorated, and that the piles and pillars which form the foundations of the buildings are rotting and will shortly be unable to stand the pressure upon them. Sinking has been observed in the subsoil for many years. Nevertheless, the City Council has decided to rebuild the Campanile on St. Mark's Square.

In the New England district of New South Wales, Australia, it is said there are enormous deposits of zinc in lodes from 40 to 50 feet wide, containing zinc ore in combination with copper, silver and lead. The existing reduction works are unable to treat the ore, but under the stimulus of the bonus which the Australian Government proposes to give for the production of spelter a marked development in the industry is looked for.

D. H. Jack of Bradford, Pa., and associates are reported to be organizing a company to pipe natural gas from the Pennsylvania fields to Elmira, N. Y.

It is stated that the Standard Oil Company will build in England a fleet of 12 steamships, of 40,000 barrels capacity each.

TRADE REPORT.

MARKET SUMMARY.

Pig Tin is exceedingly quiet, and about $\frac{1}{4}$ c. higher.
Copper is weak and dull.
Pig Lead continues dull and steady.
Spelter is about $\frac{1}{8}$ c. higher, with better demand and continued scarcity of stock.
Antimony is slightly lower in price, and quiet.
Nickel is in good demand and without change in price.
Aluminum is firm and in good demand.
Tin Plates are quiet, with retail prices a little less firm.
Sheets are quiet, except for the heavy gauges, and the market is a little weak.
Old Metals are quiet and unchanged.
Scrap Zinc is $\frac{1}{8}$ c. higher.
Foundry Iron is very scarce and prices nominal.
Sheet Copper is in fair demand and firm in price.
Sheet Zinc is firm; demand is moderately active.
Hardware prices are strong in all lines, with advancing tendency in some, but business is quiet.
Cast Iron Soil Pipe and Fittings have been advanced in price by New York jobbers.
Plumbers' Brass Work is very active on the recent advance in prices.
Cast Iron Sinks are generally in good demand, but prices vary materially.
Hollow Ware has been marked up again in price.
Oilers are somewhat lower in price, owing to termination of manufacturers' agreement.
Building Papers are very strong and active.
Wire Nails are active and firm.
Cut Nails are in moderate demand at unchanged prices.
Linseed Oil is quiet, but firm.

METAL MARKET.

NEW YORK, July 18, 1902.

Pig Tin.—The stock of Tin on hand in this market is under close control. Manipulators succeeded in advancing prices considerably in the early part of the week. On Thursday, however, the upward movement received a check, and there was a slight reaction, leaving as a result, prices about $\frac{1}{4}$ c. above those given in our last report. Straits Pig in small lots is quoted by jobbers at 29 $\frac{3}{4}$ c. to 30 $\frac{1}{4}$ c. per lb. The amount of actual business transacted during the week was very small, purchases for consumption being unusually light, even for this dull season of the year. Arrivals of Tin thus far this month have been small, amounting to but 872 tons. The amount afloat and expected before the end of the month is 3073 tons.

Copper.—The Copper market continues weak, and is a shade lower than at the date of our last report, there having been a steady decline during the last few days. Although offerings were very liberal, buyers have hesitated to purchase. The consuming demand at present is small. It is said that several mills are still closed for repairs. Jobbers quote Lake Ingot in small lots at 13c. per lb., and Casting Copper at 12 $\frac{1}{2}$ c. to 12 $\frac{3}{4}$ c. The monthly production for June in this country was very large and occasioned considerable comment. It amounted to 26,740 tons.

Sheet Copper.—Although the demand for Sheet Copper continues in satisfactory volume, it is hardly as large as it was a few weeks back, which is accounted for by the advance in the season. A considerable amount of Sheet Copper is going into consumption, however, and the outlook favors a continued steady demand. Prices are firm on the basis of 18c. per lb. for Sheet Copper from store.

Pig Lead.—Nothing of interest has been developed in

connection with this metal. Business is light, and prices are steadily held on the level obtaining for some months past. American Pig in small lots is quoted at 4.45c. to 4 $\frac{1}{2}$ c. per lb. St. Louis advices report no new features in the Pig Lead market at that point, affairs continuing in a quiet, dull condition without any change in quotations.

Spelter.—The market for Spelter is stronger than ever and prices have made a further advance. Spot stocks continue scarce, with a fairly active demand and good inquiries for August and September delivery. Consumers are said to be fairly well supplied for immediate requirements, but none of them have any stock on hand to speak of. The producers also claim to be rather bare of stock, although it is reported in the trade that some good sized offerings have been made for early delivery. Jobbers are quoting good Western brands in small lots at 6c. to 6 $\frac{1}{8}$ c. per lb. The price of Spelter has not been as high as it is now in over two years. St. Louis advices indicate the continuance of heavy transactions in the Spelter market, with a considerable increase in prices.

Sheet Zinc.—The demand for Sheet Zinc is of ordinary proportions. Prices are firm at 6 $\frac{3}{4}$ c. per lb. for 600-lb. cask lots and 7 $\frac{1}{4}$ c. to 7 $\frac{1}{2}$ c. for smaller quantities.

Antimony.—There has been a slight decline in the price of Antimony, with a light demand. Prices were steady at the close at 10 $\frac{1}{2}$ c. to 10 $\frac{3}{4}$ c. per lb. for Cookson's in small lots, 8 $\frac{3}{4}$ c. to 8 $\frac{7}{8}$ c. for Hallett's and 8 $\frac{1}{2}$ c. to 8 $\frac{3}{4}$ c. for other brands.

Nickel.—This metal is unchanged. Small lots are quoted at about 5c. per lb.

Aluminum.—The demand for Aluminum continues active and prices are without change. Small lots of No. 1 Ingot, guaranteed 99 per cent. pure, are quoted at 37c. per lb. and 100-lb. lots at 35c.

Tin Plates.—Nothing new has been developed in this market, which continues quiet with an absence of any large business. The retail trade also shows the influence of summer dullness in a falling off in the number of small orders. Prices in the general market are unchanged, but more liberal deliveries from the mills have resulted in the withdrawal of some of the outside prices asked by jobbers during the winter and spring. Thus Bright Charcoal Plates in this market now rule about 25c. a box lower than they did a while ago, and ordinary Terne Plates are also now quoted at about a similar reduction. Jobbers quote American Bessemer Coke Plates, 1C, 14 x 20, in moderate sized lots, delivered in New York or corresponding points, at about \$4.75 to \$4.90 per box. Cable advices report a further decline of 1 $\frac{1}{2}$ pence in the price of Welsh Plates, the quotation now being 13 shillings 3 pence, f.o.b. Swansea.

Sheets.—The Sheet market generally is rather quiet, the demand for Light Black Sheets and Galvanized Sheets being particularly dull. The tone of the market is weak, notwithstanding that the heavier gauges of Black Sheets continue in good demand, and most of the mills are still behind in their shipments. A good many Sheet mills are closed down for repairs, &c., and the output has been cut down materially. This may have the effect of putting the market in better shape before long. Retail prices in the Eastern market are rather lower on both Black and Galvanized Sheets, the quotation on No. 27 One Pass Cold Rolled Soft Steel Sheets now being at about 3.70c., and on No. 24 Galvanized at 4c. to 4.10c.

Chicago advices are as follows: The market has continued slow and easy for Light Sheets, but Heavy Sheets are steady. Quotations are unchanged. No. 27 Black Sheets in small lots from store are quotable at 3.45c. to 3.55c., and Galvanized Sheets, small lots from store, at 4.70c. to 4.75c. for No. 27.

Old Metals.—Although the demand for Scrap Metals is not very active, prices remain fairly firm through the

list, and are unchanged, except for Scrap Zinc, which is $\frac{1}{8}$ c. higher, owing to the high price of raw Spelter. Dealers are paying about the following rates for moderate sized lots, delivered at New York or corresponding points:

Heavy Copper.....	per lb.	10 c.
Light and Tinned Copper.....	per lb.	9 c.
Heavy Brass.....	per lb.	8 c.
Light Brass.....	per lb.	6 $\frac{1}{2}$ c.
Lead.....	per lb.	3 $\frac{3}{8}$ c.
Tea Lead.....	per lb.	3 c.
Zinc.....	per lb.	3 $\frac{1}{8}$ c.
Pure Aluminum Sheet.....	per lb.	22 c.
Cast Aluminum.....	per lb.	17 c.
No. 1 Pewter.....	per lb.	18 c.
No. 2 Pewter.....	per lb.	9 c.
Tin Plate Scrap, per gross ton.....		to \$5.00
Wrought Iron Scrap, per gross ton.....		\$13.00 to 13.50
Heavy Cast Scrap, per gross ton.....		12.00 to 12.50
Stove Plate Scrap, per gross ton.....		8.50 to 9.00
Burnt Iron, per gross ton.....		7.00 to 7.25

THE PIG IRON MARKET.

NEW YORK.—The scarcity of Pig Iron for early delivery has become more acute through the continuance of labor troubles. The Birmingham furnaces, which were banked, are expected to resume at an early date. There are further reports of sales of foreign Iron. It is difficult to quote American Pig Irons for nearby delivery, and the following figures are nominal: Northern Iron, at tidewater, No. 1 X, \$23.50 to \$25; No. 2 X, \$22.75 to \$23.50; No. 2 Plain, \$22.25 to \$22.50. Tennessee and Alabama brands are quoted as follows: No. 1 Foundry, \$22.50 to \$23.50; No. 2 Foundry, \$21.75 to \$22.50; No. 3 Foundry, \$21.25 to \$21.75.

CHICAGO.—Continued demand for Iron for next year's delivery is the leading feature of the market, but the center of activity has been transferred to the Southern companies, although Northern Iron is still in demand. No very large sales have been made during the week, but between 20,000 and 25,000 tons have been sold on the basis of \$17, Birmingham, for No. 2 Foundry, the deliveries extending from January to June, 1903. Large buyers, including the stove foundries, have been making urgent inquiries for lots of 2500 to 3000 tons each. A few lots of Southern No. 1 and 2 Foundry have been sold at \$24.65 to \$23.65 respectively for November and December delivery, and a few hundred ton lots of No. 1 Southern Foundry to be shipped in July have cost \$25.65. As a rule, however, scarcely anything is obtainable for prompt shipment, or for delivery during the current year. A further advance of \$1 per ton on Southern Iron is being considered. The following are the nominal quotations for delivery during the current year:

Lake Superior Charcoal.....	\$25.00 to \$26.00
Local Coke Foundry, No. 1.....	22.00 to 22.50
Local Coke Foundry, No. 2.....	21.50 to 22.00
Local Coke Foundry, No. 3.....	21.00 to 21.50
Local Scotch, No. 1.....	22.50 to 23.00
Oblo Strong Softeners, No. 1.....	24.00 to 25.00
Southern Silvery, according to Silicon.....	24.65 to 25.15
Southern Coke, No. 1.....	24.15 to 24.65
Southern Coke, No. 2.....	23.65 to 24.15
Southern Coke, No. 3.....	23.15 to 23.65
Southern Coke, No. 1 Soft.....	24.15 to 24.65
Southern Coke, No. 2 Soft.....	23.65 to 24.15

PHILADELPHIA.—Under such conditions as are now ruling, exact quotations cannot be expected. Every buyer and seller has his own ideas in regard to the situation, and these vary extremely; consequently, one man's price has little or no influence on what another man's price will be. Buyers, however, are not bidding quite as high figures, although Iron for quick shipment is scarcer than ever, except for something they must have at once, purchasers abstain from buying except in a small way at the figures recently quoted. Present prices for 1903 deliveries appear to be about as follows. For this year, 50c. to \$1 more, according to circumstances:

No. 1 X Foundry.....	\$23.50 to \$24.50
No. 2 X Foundry.....	22.00 to 22.50
No. 2 Plain.....	21.50 to 22.00

PITTSBURGH.—The Pig Iron market is exceedingly strong. Many of the furnaces are so short of Coke that they are not turning out more than one-half of their regular output. Several furnaces are shut down and others may have to stop any day. No. 2 Foundry Iron is quoted at \$22 to \$22.50, Pittsburgh, depending on tonnage and deliveries wanted.

CINCINNATI.—The Pig Iron market has shown but

little change one way or another during the week. The supply of Foundry Iron from any source for this year's delivery is still practically nothing. The small lots that are available are selling about as they have been for the past few weeks, on the basis of \$18 to \$19, Birmingham, for No. 3 Foundry. Northern Irons are very scarce and practically unchanged as to price. We quote, f.o.b. Cincinnati, for 1902 delivery, as follows:

Southern Coke, No. 1.....	\$21.25 to \$22.25
Southern Coke, No. 2.....	20.75 to 21.75
Southern Coke, No. 3.....	20.25 to 21.25
Southern Coke, No. 4.....	19.75 to 20.75
Southern Coke, No. 1 Soft.....	21.25 to 22.25
Southern Coke, No. 2 Soft.....	20.75 to 21.75
Oblo Silvery, No. 1.....	24.60 to 25.10
Oblo Silvery, No. 2.....	24.10 to 24.60
Lake Superior Coke, No. 1.....	25.10 to 25.60
Lake Superior Coke, No. 2.....	24.60 to 25.10
Lake Superior Coke, No. 3.....	24.10 to 24.60

ST. LOUIS.—The same quiet conditions are apparent in the Pig Iron market and the volume of new business being executed at this point is of a very light order. One sale of about 1000 tons of Southern Foundry Iron for the last half is the only order of any moment that comes to our notice this week. Furnaces are as yet reluctant to name the figure for 1903 delivery. The following is the range of prices current for cash, f.o.b. St. Louis:

Southern, No. 1 Foundry.....	\$21.50 to 23.50
Southern, No. 2 Foundry.....	20.75 to 22.75
Southern, No. 3 Foundry.....	20.25 to 22.25
Southern, No. 4 Foundry.....	19.75 to 21.75
No. 1 Soft.....	21.25 to 23.25
No. 2 Soft.....	20.75 to 22.75

CHICAGO REPORT.

Scrap Iron and Steel.—There has been a moderate movement from city yards, but the freight handlers' strike has prevented the handling of carload business. A firm tone continues, however. Dealers buy offerings in carload lots, Chicago delivery, as follows:

	Per net ton.
Country Wrought Scrap.....	\$14.00 to \$14.50
Machinery Cast.....	to 13.50
Malleable Cast.....	12.00 to 13.00
Stove Plate (free from burnt).....	to 9.50
Burnt Iron and Grate Bars.....	8.00 to 9.00
Sheet Iron and Hoops.....	8.00 to 9.00
Flow Steel.....	12.00 to 13.00
Breaking Stock.....	to 11.00
Old Rollers—whole (Iron).....	9.50 to 10.00
Old Rollers (Iron) cut in single Sheets and Rings.....	12.00 to 12.50
Old Gas Pipes and Boiler Tubes.....	12.00 to 12.50
Cast Borings.....	8.50 to 9.00
Turnings.....	12.00 to 12.50
Horseshoes.....	14.00 to 14.50

Old Metals.—Copper and Brass of all kinds have continued slow and easy, and, outside of city business, there has been scarcely any movement. Prices, however, of all kinds are well sustained. Zinc is especially firm. The following prices are being paid by dealers in this market:

	Per lb.
Copper Wire and Heavy.....	10 $\frac{3}{4}$ c.
Copper Bottoms.....	9 $\frac{3}{4}$ c.
Copper Clips.....	10 $\frac{1}{2}$ c.
Red Brass.....	10 $\frac{3}{4}$ c.
Yellow Brass.....	8 $\frac{1}{4}$ c.
Red Brass Borings.....	9 $\frac{3}{4}$ c.
Yellow Brass Borings.....	7 $\frac{1}{2}$ c.
Light Brass.....	6 $\frac{3}{4}$ c.
Pipe Lead.....	3.70c.
Tea Lead.....	3.35c.
Zinc.....	3 $\frac{1}{4}$ c.
Tin Foll.....	21 c.
Pewter, No. 1.....	18 c.
Pewter, No. 2.....	11 c.
Aluminum.....	20 c.

Old Rubber.—The market has presented few changes, but business has been confined to the city trade. Prices of all kinds are without essential change:

	Per net ton.	Per lb.
Garden Hose.....	\$25.00
Air Brake Hose.....	45.00
Rubber Shoes.....	7 c.
Rubber Car Springs.....	5 c.
Inside Bicycle Tubing.....	22 c.
Outside Tubing.....	5 $\frac{1}{2}$ c.
Black Rubber.....	4 c.
White Rubber.....	8 $\frac{1}{2}$ c.

Rags.—The market has remained nominally unchanged, business being practically suspended except within the city limits. Dealers continue to buy liberal offerings at 65 to 75 cents per 100 lbs., Chicago delivery.

Anthracite Coal.—The situation is unchanged, there being very little new business, but a fair movement on previous contracts. Following are the prices current,

subject to a discount of 20c. for shipment made during July:

	Grate.	Egg and Stove.
Chicago	\$5.75	\$6.00
Milwaukee, Wis.....	5.75	6.00
St. Louis.....	6.20	6.45
Kansas City, Mo.....	8.25	8.50

THE HARDWARE TRADE.

The midsummer season is operating against activity in business, and as a rule the volume of trade is smaller than for some time. This applies to both the manufacturer and the jobber, who agree in reporting a falling off in the number of orders which are coming in to them. The force of traveling salesmen are, however, about getting into the field and are beginning to be heard from, and there is little doubt that their activities will result in increasing the volume of business. Manufacturers are generally endeavoring to give their plants the overhauling usual at this season, but many of them find the pressure of orders such as to make it a somewhat difficult task. In connection with the repairs and cleaning up many of them are making substantial additions to their factories or otherwise increasing their facilities. There is no doubt that the prosperous conditions which have prevailed have operated in giving manufacturers in nearly all lines a materially larger capacity, and at the same time there has been the encouragement of a good deal of competition, making the aggregate output in the various lines substantially greater than it was two or three years ago. This is notably the case in lines in which there have been strong organizations or dominant interests occupying a controlling position in the market. In some of these branches of the trade the new competition which is coming into sight, and is in some lines active in the field already, promises to give the trade wider and more diversified sources of supply than has recently been the case. Whether in all these lines the demand during the coming fall will be of such volume as to keep prices where they now are is a question which is being canvassed. Up to the present time most lines of goods are very firmly held, and in only a few are there indications of a slight weakening, and under the influences referred to above. In most departments of the trade the high price of material is giving strength to the market, and in a number of minor goods higher quotations are announced. The strikes which command public attention have a perceptible effect in diminishing the volume of business, not only by their direct influence in interfering with trade, but in the uneasy feeling which they occasion, from which there results an indirect loss which is perhaps equally serious. Reports from the crops leave no doubt that the harvest as a whole will be most abundant, and in this fact, coupled with the existing wonderful prosperity, there is found basis for the confident anticipation of a heavy trade during the remainder of the year.

NOTES ON PRICES.

Cast Iron Soil Pipe and Fittings.—Under date of July 14 the jobbers of Plumbing Supplies in the territory of Greater New York have advanced the price of Cast Iron Soil Pipe and Fittings. The advance on the sizes from 2-inch to 6-inch is in accordance with the change made on July 1 by the manufacturers and amounts to an increase of 5 per cent. The change on the larger size of Pipe and Fittings is much more in excess of the manufacturers' change in cost and amounts practically to an advance of 20 per cent. from the previous quotations governing sales in this territory. The scarcity of Cast Iron Soil Pipe and Fittings has had more to do with the advances made by the jobbers than the advance which the manufacturers put into effect on the first of the current month. A report which comes from an authoritative source this week is to the effect that the manufacturers of Cast Iron Soil Pipe and Fittings are again about to make a change. It would not be surprising to hear that the advance will be greater than the previous one, as the manufacturers are put to their wits' end to procure the raw material for their plants.

The present retail prices on Soil Pipe and Soil Pipe Fittings in New York are as follows:

	Discount.
2 to 6 inch Standard Pipe.....	50 %
2 to 6 inch Extra Heavy.....	60 %
2 to 6 inch Standard and Extra Heavy Fittings.....	65 %
Larger sizes Pipe and Fittings.....	40 %

Plumbers' Brass Work.—The advance in the price of Plumbers' Brass Work, which took effect on June 23, is being adhered to by all manufacturers in and outside of the association. It is said that never before has there been such a scarcity of Brass Work, and that this is the first time the manufacturers are making a respectable profit on their output. The jobbers are covered for all their supplies, but they cannot procure the goods from the factories as the manufacturers are getting better prices for prompt deliveries from many of the jobbers who were uncovered for their wants and are now buying from hand to mouth to fill orders. Orders of this character always command higher prices than do stock orders which are placed with the manufacturers during the dull seasons. The business this year surprised the jobbers and manufacturers alike. Very few of them anticipated such good business as is being done, and they were not found in readiness to handle it now that it is here. Prices are higher than they have been at any time during the past four years. Stocks with the jobbers were never so small, and the season is now at its height. Everybody is demanding immediate shipment, and goods are being sold at profits which are satisfactory alike to the manufacturer and jobber.

Plumbers' Supplies.—At the joint meeting of the Central Supply Association and the Association of Manufacturers and Jobbers of Plumbers' Supplies, which was held at Niagara Falls, N. Y., on June 24, 1902, the following charges for boxing and packages were agreed upon and adopted:

Earthen Ware, Marble and Copper Boilers, at manufacturers' rates.

Minimum charges on other packages as follows:

Bags, 10 cents, net; kegs, 15 cents, net; barrels, 25 cents, net; boxes 24 x 18 x 12 inches, or equivalent dimensions or smaller, 15 cents, net; larger boxes at 10 per cent. on the cost.

All of the jobbers holding membership in the above named associations are to charge the foregoing prices.

Cast Iron Sinks.—The market for Cast Iron Kitchen Sinks is characterized by some irregularities. The manufacturers are quoting independently of any agreement, and prices are considerably divergent although inclined to advance in most cases. There is a scarcity in some of the leading sizes, and most of the manufacturers are considerably behind their orders.

Hollow Ware.—A further advance has been made in Stove Hollow Ware, and the market is characterized by a decidedly firm tone.

Oilers.—The agreement between the manufacturers of Oilers, Brass, Zinc, &c., has terminated, and the market is now an open one. Somewhat lower prices are being announced, but no very serious irregularity has as yet developed.

Casters.—The manufacturers of Casters have recently been withdrawing some of their extreme discounts, and the market is accordingly slightly higher, and is characterized by a firm tone.

Building Papers.—The market for Building Papers, both in Tarred Felt and Rosin Sheathing, is very strong, in consequence of the shortness of the supply of these materials. The demand for this material has been unusually heavy this season and the manufacturers have been unable to promptly fill all the orders they have received. It will take some little time before they come abreast of their deliveries on orders, but there are already indications of a decline in the demand as the season advances, which will enable the makers to more readily meet the wants of their customers.

Mica.—Eugene Munsell & Co., 218 Water street, New York, have issued a new price-list covering all sizes of selected North Carolina and Wyoming Mica. The market for Mica is active and prices rule firm.

Wire Nails.—The demand for Wire Nails in the New York market is somewhat beyond what is usually ex-

pected at this season. Quotations remain unchanged at \$2.30 per keg for small lots of Wire Nails from store.

Cut Nails.—Cut Nails are in moderate demand at this point, and at the prices ruling for some weeks past. Small lots from store are quoted at \$2.30 per keg. The scarcity of Iron Cut Nails still continues.

Linseed Oil.—The demand for Linseed Oil at present is very small, but prices remain firm and unchanged, City Raw in small lots being quoted at 68 to 68½ cents per gallon. There is a report current that the price of Oil will be forced up during August, but this is very problematical, as the supplies are rather above the average. Indeed, good authorities claim that the outlook favors lower rather than higher prices.

TRADE NOTES.

THE STAR ALUMINUM COMPANY, with factory at Doylestown, Ohio, have been reorganized and will increase their capital to \$25,000. The company have obtained offices in the Akron Savings Bank Building, Akron, Ohio. The company are putting in new machinery for the manufacture of Aluminum Castings and Novelties. The officers of the concern are: J. Keller, president; A. W. Clapper, secretary and treasurer, and J. A. Hernan, superintendent.

UNITED STATES CONSUL-GENERAL C. E. TURNER, at Ottawa, Canada, reports that the General Electric Company are establishing a plant in that city for the manufacture of Mica. They have leased the large factory formerly occupied by the Ottawa Porcelain Company and will employ about 150 hands at the start, and about 400 in the near future.

THE AMERICAN ALUMINUM ASSOCIATION will hold their annual meeting in Pittsburgh, Pa., the second or third week of September.

THE HERRON & BURY MFG. COMPANY, Erie, Pa., issue a little pamphlet devoted to Air Compressors, Tanks and equipment, containing dimensions and particulars.

A stock company have been organized in Detroit, Mich., with a paid-up capital of \$20,000 to manufacture Galvanized Iron Tanks and Steam Cooking Stoves. The factory of Freeland & Sons of Middlebury, Ind., was purchased by the company, and the buildings will be moved to Detroit, thus securing better shipping facilities. The factory will employ about 75 hands.

A two-story building of brick and stone, 47 x 162 feet, is under course of construction by the Elkhart Brass Mfg. Company of Elkhart, Ind. Brass, Iron and Wooden Specialties will be manufactured, and the company anticipate the opening of their factory by September. The company consist of A. E. Hansen, president and manager; W. H. Anderson, secretary, and F. A. Reed, treasurer.

THE NATIONAL SPECIALTY MFG. COMPANY, Philadelphia, Pa., have issued a new catalogue relating to Sausage Stuffers, Lard Presses, Measuring Pumps, Coffee, Spice and Drug Mills, Measuring Faucets, Fruit Presses, &c. These goods are illustrated in the colors in which they are actually finished, which greatly enhances the value of the catalogue.

THE ENTERPRISE ENAMEL COMPANY, Bellaire, Ohio, have issued a catalogue of second grade Enameled Ware. The company advise us that they are moving old machinery and installing new presses in a substantial brick and stone building adjoining their present works, which will double their capacity. Another building of the same character is contemplated, which will give much needed space in their pressrooms.

THE GOODWIN & KINTZ COMPANY, Winsted, Conn., are sending out their catalogue No. 20, pertaining to Gas and Electric Portables and Newels. These high grade goods are illustrated in a variety of attractive forms. The company also produce Mirrors, Vases, Clocks, Candelabrum and Candlesticks, Five o'Clock Teas, Photograph Frames, Premium Goods, &c.

In a report regarding the demand for Hardware, &c., in Turkey-in-Asla, United States Consul Thomas H. Norton, at Harput, writes that the use of Enameled Ware

for kitchen and household use in general is steadily increasing in that country. He finds, however, a marked dissatisfaction with the poor grade of coating on the Enameled Utensils of European make. It is said that they render but a very limited service, while enameled vessels of any size are totally lacking in that market. The Consul expresses himself as ready to facilitate the efforts of American manufacturers of Enameled Ware who care to make any efforts toward introducing their goods into his district.

JOHN P. SCHAFER, a prominent heating contractor, of Pittsburgh, Pa., was one of the visitors at *The Metal Worker* office this week. Although Mr. Schaffer installs all kinds of heating plants, he has made a specialty of Hot Air Furnace heating, and has invented a number of Furnace specialties, his latest being a Combination Gas and Coal Furnace, which has been through the test of one winter, increasing its popularity with those who have used it.

S. C. McCOWAN, superintendent of the Indian School at Chilocco, Oklahoma, will receive bids until July 28 for two 200 horse-power Boilers, two Pumps, Steam Traps, Fans, Iron Pipe and Fittings, Pipe Covering and Valves for use at the school during the year.

PERFORATED METALS
OF EVERY DESCRIPTION
FOR SCREENS OF ALL KINDS
THE HARRINGTON & KING PERFORATING CO.
217 NORTH UNION STREET.
CHICAGO, ILL., U. S. A.

STEEL, IRON, COPPER, ZINC, BRASS, TIN,
AND ALL OTHER METALS
PERFORATED AS REQUIRED
FOR
GRAIN CLEANING AND MINING MACHINERY,
WOOLLEN, COTTON, PAPER AND PULP MILLS,
RICE, FLOUR AND COTTON SEED OIL MILLS,
SUGAR AND MALT HOUSES, DISTILLERIES, FIL-
TER PRESSES, STONE, COAL AND ORE SCREENS,
BRICK AND TILE WORKS, FILTERS,
SPARK ARRESTERS, GAS AND WATER WORKS,
OIL, GAS AND VAPOR STOVES,
COFFEE MACHINERY, &c. &c.
STANDARD SIZES PERFORATED TIN AND BRASS ALWAYS IN STOCK.
NEW YORK OFFICE: 114 LIBERTY STREET

FOR SALE.

A valuable manufacturing property, situated at 23d and Smithman streets, Pittsburgh, Pa. Remarkably well located as to shipping facilities, consisting of new steel constructed building, 118 x 154 feet, thoroughly equipped with suitable machinery and tools for working in sheet metals. This establishment has a long ground lease, on very favorable terms, and a large trade that will naturally follow it. It is the only concern in the Pittsburgh district, with all machinery for making corrugated conductor pipe eaves trough, ridge roll, &c. This is an opportunity to secure a bargain for one desiring a business that can be operated at once. Any one caring to investigate, with object of buying the building, machinery, &c., or any practical party with capital caring to take an interest in the business, please address

H. L. IRWIN,
Receiver for Marlin & Co., Inc., Pittsburgh, Pa.

TINSMITHS HELPER *and* PATTERN BOOK

WITH USEFUL RULES,
DIAGRAMS and TABLES
= By H. K. VosBurgh =
NEW AND IMPROVED EDITION

A USEFUL hand-
book for tin-
ners and other
mechanics, treat-
ing simple prob-
lems in pattern
cutting, such as
are of daily occur-
rence in the shop.
An elementary
manual for the
young tinsmiths.
A handy reference
for all sheet metal
workers.

120 Pages
53 Figures

An Invaluable \$1.00
Pocket Companion . .

Section 1 ~ Pages 1-66 Diagrams and Patterns

Demonstrates in a simple way, and by means of illustrations and descriptive text, about 50 examples of sheet metal pattern work, such as the method of cutting can breasts, flared tinware, scale scoops, oval boiler covers, lips for measures, elbow patterns, &c.

Section 2 ~ Pages 69-88 Epitome of Mensuration

Compiled with regard to the requirements of the tinner, describing how to find the area of a circle, the circumference of a circle, the contents of a sphere, a cylinder, a cone, and other information relating to the work of a tinsmith.

Section 3 ~ Pages 89-120 Tables, Rules, Recipes

Gives tables of the weights of sheet metals, including the weight of black sheet iron, sheet lead, and galvanized iron sheets with their dimensions; the weight of lead pipe per foot; the weights of tin plates, sheet copper and sheet zinc. Several pages are devoted to tables giving the areas and circumferences of circles, the capacity of cans, the number of barrels in cisterns and tanks, sizes of tinware in form of frustum of a cone, &c., and practical receipts, including mixtures for solders of different kinds, soldering fluxes, and various cements.

Cloth Bound, \$1.00 Postpaid

**How
to
Make
the
Best
Roof**

MF Roofing Tin is the first requisite; capable work the second—that is all—except, the roof will last 50 years. The manufacturers of MF Roofing Tin have lately published a complete manual of roofing and roofing material which will be sent free to anyone interested in roofs.

**MF
Roofing Tin**

is made entirely by hand labor—the "old-style" process. It has the heaviest coating of pure tin and new lead—impervious to rust or atmospheric gases. Ask your roofer—or for a copy of the book,

WHAT'S · THE · USE?

What's the use of handling unartistic ceilings when you can just as well handle artistic ones?

Why exert yourself trying to get business with a limited assortment of designs to choose from when you can present the most complete line of metal ceilings upon the market?

Why try to hold your trade with poorly stamped material when you can please them so much better with material that is properly stamped?

Why try to bolster up goods for which the only argument you can offer is the argument of price when you can handle a line which is backed by the argument of quality?

In short, why handle anything but "Berger's Classic" Metal Ceilings? The most complete, most artistic, best stamped metal ceilings upon the market.

If you think there is any good reason why you should not handle

Berger's **Classic** Ceilings,
METAL CEILINGS

we are anxious to know what the reason is. Write us about it—we earnestly solicit an opportunity to show you why it will pay you to handle our line.

[CATALOGUES ON APPLICATION.]

The New Metal Worker Pattern Book.

425 Pages. 744 Illustrations.
Size 10 x 13 inches.

A new treatise on pattern cutting as applied to all branches of sheet metal work.

Cloth Bound, Price \$5.

This work contains a collection of 218 problems and an elaborate explanation of the principles of pattern cutting, including Triangulation.

It embodies the problems of the former Metal Worker Pattern Book, all of which have been revised, and many of which have been entirely rewritten and solved by more approved methods. To these have been added 75 new problems and much other new material and explanatory matter, making this work a model of completeness in every respect.

ARRANGEMENT.

In point of arrangement the new work far surpasses the former one in that the problems are classified under three different heads, and simply indexed, and also that by means of a table of contents any required department of the work can be easily found.

CONTENTS.

While Chapter VI, comprising the greater part of the work, is devoted to the solution of problems, the five preceding chapters thoroughly explain the principles of pattern cutting, and place the student in possession of the preliminary information necessary to a thorough understanding of the subject.

SUMMARY OF CONTENTS.

- I. Terms and Definitions—15 pages.
- II. Drawing Instruments and Materials—13 pages.
- III. Linear Drawing—6 pages.
- IV. Geometrical Problems—35 pages.
- V. PRINCIPLES OF PATTERN CUTTING—25 pages.
- VI. PATTERN PROBLEMS (3 Sections)—325 pages.
 1. MITER CUTTING,
 2. FLARING WORK,
 3. TRIANGULATION.

All Tinnerns, Cornice Makers and Sheet Metal Workers should be provided with a copy of

The New Metal Worker Pattern Book.

HARE'S FOUR LEAF CORNICE BRAKE.

Hundreds sold and never a complaint. Works easily and rapidly. The universal verdict is, IT IS THE BEST IN THE WORLD.

96 inches long.

Our Improved Eureka Cornice Brake. Will bend No. 20 iron.

96 inches long.

CORNICE MAKERS' SQUARING SHEARS. With Lever Arc, Automatic Gauge. Will cut No. 2 iron, 97 inches long.

HERCULES SHEARS

make the cutting of sheet metal of heavy gauges an easy task for the mechanic and a profitable operation for the employer. With them a man can cut No. 12 steel with one hand on the lever, leaving the other hand free to guide the stock while cutting elbows, ties and circles, as small as 8 inch radius; this is done without burring or buckling either piece, thus avoiding hammering and straightening, which add to the cost of the product. They split sheets of any width or length up to No. 12 gauge, cut wire or bar-steel $\frac{1}{8}$ inch thick, cut off and mitre angle iron $\frac{1}{8}$ inch thick, and do it perfectly.

—HER CHANCE.—“Look at those two bad boys in the river,” said Mr. Markley, as they crossed the bridge.

“By the way, dear, that reminds me,” replied his wife. “Let me have a couple of dollars? I’ve got to get a pair of undressed kids.”—*Philadelphia Press*.

—LET HIMSELF OUT.—“I constructed a fire escape yesterday in about two minutes.”

“Come off!”

“Fact. I heard the boss was going to discharge me, so I wrote a letter of resignation and handed it in at once.”—*Philadelphia Press*.

—A DREADFUL STATE.—He: “Well, we can’t believe more than half we hear.” She: “Oh, worse than that; I can’t believe more than half I say.”—*Pittsburgh Dispatch*.

—IN A COLLEGE TOWN.—Student (to servant at the door): “Miss Brown?”

Servant: “She’s engaged.”

Student: “I know it. I’m what she’s engaged to.”—*Exchange*.

Hot Blast Attachment.

The Gas Ring around the firepot evenly distributes a good volume of superheated air over the surface of the fire, effecting complete and rapid combustion of the gases which usually pass off through the smoke pipe unutilized. It intensifies the heat from the fuel and prevents the formation of clinkers.

NEW PALACE KING

Hot Blast Smoke Consumer

WARM AIR FURNACE

For Soft Coal.

A Heavy, Substantial, all Cast Iron and Strictly High Grade Heater;
Especially Constructed for Soft Coal Fuel.

THE HOT AIR BLAST APPLIANCE

Is so formed that the distribution of the hot air to the combustion chamber is equally divided at three points; at the back and on each side. This appliance embodies the important advantage of a hot air blast and also the very vital point of a durable construction. This question of durability of a hot blast appliance for soft coal fuel is one that has caused much annoyance and expense, and in this construction we have carefully provided for this important point. It is not a part of the combustion dome or fire-pot, insuring equal expansion and contraction. The air is discharged into the combustion chamber directly over the surface of the fire, and at a very high temperature, yet the construction is such that the combustion does not come in direct contact with it; the parts are allowed to expand and contract equally.

**WE WISH TO CALL ATTENTION TO OUR NEW
OAK STOVES ON THE FOLLOWING PAGES**

The **OAKVALE ANDES**

A new departure in stoves, being an entirely original form of Oak Stove with Full Return Flue and Tea Kettle Attachment in as good form and as good an operator, also as economical, as any base burner ever produced.

The **OAK ANDES**

as shown hereafter for the year 1902 is unquestionably one of the best if not the very best Oak Stove offered to the public at this time.

The **GENEVA OAK**

An entirely new medium price stove. Made to meet the demands of the times.

**ALTOGETHER THESE THREE STOVES MAKE THE
BEST LINE YET OFFERED TO THE TRADE**

MADE BY

Phillips & Clark Stove Co.

GENEVA, N. Y.

The OAKVALE ANDES

An Entirely New
Full Return Flue
Base Burning Oak
Stove.

Unquestionably
the best Heating
Stove ever offered
to the Public.

Absolutely
Air Tight.

MADE IN THREE SIZES:

No. 141, having 14-inch Fire Pot
" 161, " 16-inch " "
" 181, " 18-inch " "

THIS STOVE is offered with the full assurance that it is not only attractive in appearance, but absolutely good in quality.

THE JOINTS are entirely new form and thoroughly bedded in asbestos cement.

THE DAMPERS are ground in emery, making them perfect fitting, and altogether this Stove is as near **air tight** as it is possible to make one, thus insuring perfect control and consequent **satisfaction**.

THE PRICES are reasonable considering the article in question.

THE BEST FORM OF TRIANGULAR GRATE is used for coal. **Wood Grates** are also provided when desired.

IT IS SOLD WITH OR WITHOUT THE MAGAZINE.

THE ASH PAN is unusually large.

THE PLATED TRIMMINGS are massive in appearance and of the very best quality.

THE FLUES are of the most approved base burning construction, the heat from the fire chamber passing down the back flue in and under the base, returning through the same to the upright flue, thence to the exit, thus retaining in the stove the heated products of combustion as long as it is possible to do so.

THIS STOVE is also made as a **double heater**.

THE DOUBLE HEATING ARRANGEMENT in the **Oakvale Andes** is an entirely new arrangement and will prove entirely satisfactory in actual operation.

IT IS FULLY GUARANTEED TO GIVE PERFECT SATISFACTION when properly set under fair conditions.

MADE BY

Phillips & Clark Stove Co.

GENEVA, N. Y.

The OAK ANDES FOR 1902

Almost entirely new, having every essential feature of a perfect Oak Stove

With Triangular Grate for Coal; also Wood Grate when desired

THE OAK ANDES has been very much improved for the year 1902. It is claimed that our Oak Stoves heretofore have been as good as were on the market at the time, but with the present production it is claimed that it is far in advance of any other Oak Stove offered to the public; **the improvements being Two Feed Doors, A Much Larger Ash Pan, A New Form of Triangular Grate, More Substantial Base and Bottom, and an Entirely New Foot Rail.**

Considering size, weight and quality, we think that the prices are very favorable.

IT IS MADE IN THE FOLLOWING SIZES:

No. 614, having 14-inch Fire Pot.

No. 618, having 18-inch Fire Pot.

" 616, " 16-inch " "

" 620, " 20-inch " "

THE THREE SMALLER SIZES ARE ALSO MADE AS DOUBLE HEATERS.

THE FIRE POT in this Stove is almost straight, making it much more desirable in actual service, as the ashes will not hang on the pot, thereby preventing good radiation.

SIMPLICITY OF CONSTRUCTION and ease of repairs in all its parts are mentioned as improvements in this pattern. **The Automatic Cover** in the top, **Spacious Magazine** when desired, also **Register Wood Grate** when using wood entirely, are all of the most approved kind and forms.

THE DESIGN as a whole is certainly very pleasing, and the stove dealer who desires to sell a strictly good Oak Stove should secure the agency of the **OAK ANDES FOR 1902.**

MADE BY

Phillips & Clark Stove Co.

GENEVA, N. Y.

The GENEVA OAK

THE GENEVA OAK is made to meet the demand for an Oak Stove which might have all the essential features of higher priced goods and yet sell at such rates as will enable it to come within the reach of a large number of buyers.

MADE IN THREE SIZES:

No. 131, having 13-inch Fire Pot.

No. 151, having 15-inch Fire Pot.

No. 171, having 17-inch Fire Pot.

ESSENTIAL FEATURES.

THE ASH PAN is unusually large and will be found to be a great convenience.

THE GRATE is of the triangular form, which is acknowledged to be the only proper grate to use in an Oak Stove, and as made in the **GENEVA OAK** is of the most approved style. By the use of this Grate the fire can be agitated and the clinkers removed with the utmost ease so the fire may be kept as long as desired.

THE MAGAZINE for Coal is of ample proportions and is a great convenience when using coal constantly.

THE MICA DOOR gives a cheerful appearance, and as the Mica is protected by perforated tin it will last much longer than it otherwise would.

THE DAMPERS are of the register pattern and enable the user to at all times have the fire under perfect control.

THE TRIMMINGS are neat and attractive.

THE PLATED FOOT RAIL screens the fire pot from view and at the same time answers as a useful foot rail when so desired.

THE GENEVA OAK is unquestionably the best stove of this grade on the market, and all who desire a medium priced stove can buy it with *the full assurance that it will meet their wishes.*

PATENTED.

STRAIGHT FROM THE SHOULDER.

There are lots of dealers who have listened to plausible tongues and put in a stock of furnaces, only to find that these furnaces did not do what they were claimed to do.

Possibly these furnaces are not particularly bad. Maybe they are about as good as the run of furnaces. That makes no difference.

A furnace ought to realize every claim that is made for it by its manufacturer. If it does not it amounts to just plain lying and a black fooling of that dealer.

There isn't a dealer in this country who has been disappointed one iota in the Peck-Williamson Underfeed Furnace.

We will make that stronger. There isn't a user of the Peck-Williamson Underfeed Furnace in this country to our knowledge who doesn't congratulate himself every winter.

The Peck-Williamson will do just what we say it will do.

We claim that it will save more fuel than any other furnace made. Operates at from 1-2 to 1-3 cost of other furnaces.

We claim that it will give more heat, ton for ton of coal, than any other furnace built. We mean every word of it. We stand ready to prove it.

You take a furnace that feeds coal from underneath, and does not force combustion and does not allow gases and carbon and smoke to rush up the chimney, it is going to save coal. You can't figure it out in any other earthly way.

The Peck-Williamson Underfeed Furnace is the furnace all men are coming to. It is the only furnace that can be sold in your community shortly. The man to whom you sell this furnace will thank you every winter after. The trade of your place is yours if you want it.

Our new booklet will show you just how you can get this trade. Say the word.

Ask about the Peck-Williamson Laundry Dryer, the labor-saving, clothes-saving kitchen necessity.

KITCHEN BOILER CONNECTIONS.

A SELECTION OF
Practical Letters and Articles
Relating to Water Backs and
Range Boilers.

FIFTH ENLARGED EDITION.
194 Pages, 113 Illustrations, 6 x 9 in.
Cloth Bound.

Price, \$1.00, Postpaid.

Press Notices of First Edition :

The book is a practical helper to every member of the plumbing trade, who, being alive to his own interests, should embrace this opportunity to obtain the valuable instruction in which the work abounds.—*New England Stove, Hardware and House Furnisher.*

The *Metal Worker* produces in this volume a number of queries, with answers thereto, which have appeared in that paper. It will be seen that any plumber who is troubled to make boilers work satisfactorily will here find his troubles alleviated. It contains numerous illustrations and throughout is highly practical from the standpoint of the plumber. It contains a table of contents and an index.—*Scientific American.*

Both interesting and instructive to our trade. It shows how mistakes are apt to arise and how they may be overcome.—*Plumbers' Trade Journal.*

The publisher of this work is well known for his former successful efforts in the publication of useful and thoroughly practical books for metal workers and steam fitters. The book before us is a model of its kind in judicious compilation, practical instruction, neat illustrations and general typographical appearance.—*The Master Steam Fitter.*

The book is well got up and the information well given. Those interested in works of this character will do well in buying it.—*The Plumber and Decorator.*

Can be considered an authority on the subject to which it relates.—*American Engineering.*

Nearly every problem is illustrated fully and this interesting question of water back connections will be found to be quite fully treated in the volume.—*Domestic Engineering.*

A Tea-Kettle Boils Quicker on my Chimney than on my Stove.

IS IT SO?

It is said that a tea-kettle will boil quickest on top of a chimney. However that may be, all agree that there is too much heat wasted there. Nothing but the cross tube **ROCHESTER RADIATOR** has ever trapped it. If you were to heat a poker, would you hold it at the side of the flame or over the top? Or would you cook food on the side of a cook-stove in preference to the top? It is thus with the **ROCHESTER RADIATOR**, which takes the heat from the top of the current and not from the side. The cross tubes cool the hot current, just as you would blow across a cup of tea to cool it, only there are from 96 to 120 such currents in operation.

Semi-Sectional View.

Every Practical Stove Dealer

knows that heat without circulation is valueless. The best circulator gives the best heat.

New Era Radiators have *perpendicular* tubes. They take the cool air in at the bottom and rapidly heat it in the natural way *as it ascends*. Their construction tends to *increase* circulation instead of *retard* it, as tubes in any other direction would. All the products of combustion are compelled to touch the outer or inner surface of the tubes and the maximum amount of heat is radiated and circulated throughout the room.

If you would sell the best Radiator, you must buy the best. "*New Eras*" are best in material, best in workmanship, best in appearance, and best in results. Made in three styles and many sizes. Prices are right, affording a large margin. Don't buy something cheap on which you make but little. People are willing to pay a fair price for a good article. Send for our inducements now and be prepared to talk *New Era Radiators* at the right time.

No General Strike of Coal Miners.

The decision of the convention of United Mine Workers at Indianapolis last week not to declare a general strike of coal miners relieves the business situation considerably. Although it may be the general belief that such a strike would not have continued for any great length of time, as available strike funds would have soon been exhausted by the heavy drain on them, yet the suspension of all coal mining for even a week or two would have seriously dislocated the business of the country and caused enormous losses. Happily, we are spared this affliction, and have but the minor problem, which is nevertheless an important one, of the duration of the anthracite miners' strike. This has now been running over ten weeks, and seems likely to continue considerably longer, especially if the operators are not inclined to depart from their policy of waiting for the miners to starve themselves into defeat. The United Mine Workers have pledged such financial assistance to the anthracite miners that if all union miners who are now working pay their assessments the funds thus secured will encourage the anthracite miners to hold out. A strong appeal has also been addressed to the public by the miners' convention in the hope that substantial contributions can be secured from those who sympathize with the strikers. But assessments are always hard to collect, and it will be very remarkable if the appeal to the public results in a response which will be deemed even fairly satisfactory by its authors. The amount required to sustain the striking miners is so vast that it will not be surprising if the funds forthcoming from the working miners and the public should prove so seriously inadequate as to discourage persistence in striking. In that event the end would not be far off.

Prepare For Fall Trade.

It is not too soon for the enterprising tradesman to begin preparations for the fall trade. The people will be just as backward as heretofore in getting their work done, and when the time comes they will all want it taken in hand at once. If efforts are made to induce some customers to have their work taken in hand early the result will be a better profit for the year than can otherwise be made. Of course all well established tradesmen have arranged for a sufficient stock of goods. Those, however, who have not done so should lay in a careful assortment of stoves, sheet iron, tin plate, stove pipe, elbows and supplies in proportion to their capital and credit, and this stock should be arranged conveniently

for quick handling. The next necessary thing is to get the workmen into the spirit of the occasion by impressing them with the fact that their best workmanship, greatest care and unfailing courtesy are among the essential factors that make a shop popular and their work steady. When the stock is arranged for and the men selected, the important business of getting the work in early should be taken up. The apathy due to summer weather must not be allowed to impede active efforts to induce people to be forehanded. Circulars calling attention to the desirability of undertaking stove repairs, putting the heating apparatus in readiness, painting the roof to stand the winter storms, fixing the eave trough and gutters, and so forth, left at the residences or mailed to those who are out of town, will secure many an order, not only for the goods mentioned, but probably for many other things also. The advertising columns of local papers can also be used to good advantage in bringing a man's trade to the notice of property owners and housekeepers. Circulars and newspaper notices should say just what the people ought to have told them, and they will take advantage of the advice to the profit of the enterprising tradesman. This custom has been followed by some plumbers, tinsmiths, roofers and stove dealers for a number of years, and those using it have increased their trade and made more money each year.

Quality in Demand.

One growing tendency of the American people, which is a gratifying indication of advancement in knowledge and refinement, is their increasing appreciation of what is good, in a material sense. It is a certain token of progress when people show dissatisfaction with that which is cheap and of inferior quality and reach out for the best that their means will permit them to acquire. The diffusion of knowledge, which brings with it refinement of taste, is probably the main cause of this desire for better things, and this spread of knowledge is going on more rapidly than ever before in the history of the country. That many of the manufacturers of goods in the lines represented by this journal are coming to recognize this tendency and are catering to it is demonstrated by the character of the products shown in the latest catalogues and circulars. It is noticeable, in connection with recent trade literature that cheapness is not being pushed to the front so much as it used to be, and that attention is being more generally called to excellence of quality. Manufacturers and dealers report that the demand for high grade products has been increasing with pronounced rapidity in the past few years. Consumers, they say, are showing a more marked appreciation of quality, and do not call to anything like the former extent for cheapness in goods. They are beginning to demand the best their purses can afford. The present generation, too, are better informed, through their higher education, than were their parents as to the merits and advantages of good goods, and their taste is more cultivated. Added to this is the fact that the people to-day have more money to spend and are consequently better able to gratify their tastes. The progressive manufacturer and tradesman would do well to bear these facts in mind and help along the good

work, by pushing their high grade goods as much as possible. Not only is there more profit for them in the sale of such goods, but the satisfaction their use will give to the purchaser will naturally be an inducement to them to further patronize the sciler of first-class products.

Employers and Employees.

That courteous treatment should prevail between an employer and his workmen will be conceded by all fair minded men. Anyone of any business experience is aware that harshness of treatment too often results in a bitterness of feeling on the side of both parties concerned. It is probable that under the strenuous business demands of the present day some men do not take the time, that surely would be well spent, to cultivate a cordial understanding with those with whom they are in daily contact. This has probably often led to a lack of consideration in cases where to give it would be only just, which has resulted in an indifference on the part of employees to the interests of their employers that has been a disadvantage to all concerned. That this feeling exists among many employees is palpably true, and it is also true that in too many instances it has been developed through neglect of their interests by those who employ them. Not infrequently, however, such employees, in changing from one employer to another, do not alter their course of action in accordance with their circumstances, and it is possible that an employer was suffering from some such unjust treatment when the following letter was penned to us:

Of late years I have noticed that journeymen have got less honorable than in former years. The job I have to offer is a steady one and at fair wages; and I find no fault with any man for leaving his employment to better himself. But does he not owe to his employer the consideration of at least letting him know his intentions, so that he can make his departure honorably and decently, instead of sneaking away in such a manner as only a mean man would, without saying a word, and thus leaving his employer in the lurch for a time?

Beyond doubt such treatment as is referred to by our correspondent is unfair, and while there is no proverb to the effect that two wrongs make a right, it is equally true that, in some instances, retaliatory action in return for a wrong would start the original infringer on the right line of thinking. If "honor to whom honor is due" was more frequently the motto of employers, then conscientious, honest, competent workmen would less frequently have their better feelings hurt or outraged. There are two sides to the question presented by the letter above quoted, and there is no doubt that it can be studied with advantage from both sides, when the wisdom of more generous and courteous treatment will readily be seen.

INTERESTING PHASES IN THE IRON INDUSTRY.

It is interesting to note the evolutionary process in the iron and steel industry as reflected in the markets for raw and finished material from week to week. The unprecedented demand for all sorts of iron and steel, in conjunction with the policy adopted by the large consolidated interests—to allow only a narrow margin between the prices of raw and intermediate products on the one hand and finished manufactures on the other—has made a readjustment among independent concerns necessary. During the past six months dependent consumers of steel billets and steel bars have met with more or less difficulty in obtaining adequate amounts of steel billets and bars, notwithstanding the increased production of open hearth billets noted in January, and in not a few instances mills have been compelled to suspend operations from time to time. These conditions have opened markets throughout this country to foreign steel, and not a few of the most important mills have only been able to continue in active operation by

consuming foreign material. Yet more or less difficulty has been encountered and the result has been the further building of many new domestic open hearth furnaces, it being estimated by those thoroughly conversant with the situation that by January next the production of open hearth steel will have been increased from 50 to 60 per cent. over the output of the previous year.

At the moment the closing of many mills for the usual summer repairs is reducing the consumption and causing the resale of both domestic and foreign billets, while European dealers and producers of billets are offering their products here more freely than ever—for July, August and September shipment—through personal canvass. The result can scarcely but be reduced prices, at least temporarily. But the present difficulty in obtaining adequate supplies of pig iron, notwithstanding the continued large output of the blast furnaces and the relatively light supply of scrap available, is introducing new elements calculated to retard the rapid expansion of the production of open hearth steel.

It is estimated by manufacturers of steel rails that the requirements of the railroads for rails for the year ending June 30, 1903, will be at least 2,000,000 tons, 1,000,000 tons of which already have been placed with the four rail producing interests. Of this amount about 1,250,000 tons, it is thought, will be required for renewals, the balance for extensions. Of the 1,250,000 tons probably one-fifth will be utilized for relaying. This means that only about 1,000,000 tons of scrap will be available for remelting from this source next year, and, aside from the railroad material, there will be a relatively small quantity of scrap available for the open market.

Should the enormous consumption of pig iron of the current year be continued—and it is estimated by the largest interests that the demand will continue for another year at least—manufacturers of the finished material outside of the large interests which control their own ore and coal mines and coke ovens will find themselves in an unprotected position.

Because of these facts not a few interests outside of the consolidation are purchasing iron mines and making determined efforts to provide ample fuel, recognizing that they must be independent of the large companies, whose policy it is to consume their own products of raw and intermediate material.

It is also learned that steps have been taken by large independent interests to build converters and manufacture structural shapes.

With the present slow deliveries of pig iron, the scarcity and high prices of pig iron for immediate and nearby delivery, the high prices of scrap and a stringent market, it is somewhat of an anomalous condition to find the bar iron market so weak. It must be that much of the bar iron now coming on the market has been produced from lower priced pig and scrap. It is a well-known fact that the bar iron being sold on a lower basis than 1.75 cents cannot now be replaced except at a loss, the ratio existing between the present market prices of iron bars and scrap showing a narrower margin than ever before. Still the active competition between manufacturers of bar iron and manufacturers of soft steel bars is so keen that the largest bar iron producers seem willing to meet the issue, being evidently of the opinion that it is better to hold the trade against steel, even at a sacrifice of profit, than to advance prices and run the risk of losing business, they recognizing that the maintenance of prices of steel bars at a lower level than iron bars by the largest interests is an effort to force the consumption of steel at the expense of bar iron. It is notable, however, that a respectable minority of bar iron mills take exceptions to this policy, having confidence in their ability to meet the competition of steel even at a moderate advance in prices. It is an interesting trade war, in which the chemist and the scientific mill practitioner have important parts assigned.—*The Iron Age*.

Bulletin No. 3, issued by the University of Texas, Austin, Texas, is devoted to an exhaustive analysis and description of the qualities of the coals and lignites of that State.

WHAT THE STOVE TRADE NEEDS.

We have received the following communication from a correspondent who lies awake at nights trying to evolve some scheme for the benefit of his own stove trade and incidentally that of his fellow citizens who are engaged in the same line of business:

The stove manufacturers are to be congratulated that they have one among their number who knows the stove business and what its needs are, and the sure possibilities for making big money if his plans are carried out. In his communication to *The Metal Worker* last week, under the caption "A Stove Captain Needed" he says:

The stove industry is one of far greater usefulness than the manufacture of steel rails, structural steel and other products made by the United States Steel Corporation, for every family must cook to eat and must eat to live, whereas railroads do not have to be built, neither is it compulsory to erect buildings, or even if a building must be erected it need not be composed of steel frame construction. On the other hand, every wooden or brick house contains one or more of the products of a stove foundry; this, however, is not necessarily the case with the products of the United States Steel Corporation.

What do you think of that? The idea of a lot of capitalists and other people pottering around building useless railroads and putting up buildings of steel frame construction when there is no necessity for it! Nothing has ever appeared in *The Metal Worker* that has struck at the root of the business and shown its immense possibilities as this communication has done. Look at it. "Every house contains the product of a stove foundry, but this is not the case with the product of the United States Steel Corporation;" and to think, as he says, that the whole shooting match has been run by "the buyer and the Molders' Union; and the poor devil of a manufacturer has little to do with it." Gospel truth, every bit of it; and, mind you, this does not come from a greenhorn, but from "one who has been in the business all his life."

Here we have had a large body of stove makers meeting every year, and they are generally informed by some observant brother "that its members cannot be surpassed in point of intelligence and respectability, &c.," yet they have allowed this state of affairs to prevail. He also asks that conundrum, "Why cannot stoves be exported, when nearly every other product is?" It's a measly shame, but it is a fact, and the heathen stoveless foreigners should be "stovangelized" by experts and forced to accept them. But there is one thing that must be done: no stoves should be sold abroad at less than prices ruling here. Let us be square and not imitate those men who are soaking the people here and selling the foreigners for 50 per cent. less. Full prices and no freight allowance should be the rule.

How are you going to get at the thing and put it on a money making basis? As he quotes, the "United States Steel Corporation expect to make \$140,000,000 this year," and he wonders "where the stove business comes in." As he puts it, the "buyer and the Molders' Union get most of the earnings now." Well, here is his remedy, and it is all right, you bet:

The stove business needs a captain, and needs one quickly. It needs a captain who will gather the scattered soldiers who are all fighting on their own account, and fighting each other at that, and bring them into a harmonious company and march them on as one man, shoulder to shoulder, to the success that should come to hard and earnest workers. Where can the stove business find such a captain? Does any one know?

Does any one know? Sure, Mike. Why just put an ad in *The Metal Worker*, stating your wants, and I will guarantee the man will be found. I would be willing to wager my whole week's wages (\$6) that there isn't a stove concern in the United States that hasn't got one or more of the material that could give the Lord points, let alone officerizing such a community of interest as this would be. Where did Cholly Schwab come from but out of the back woods? At the same time your correspondent is entitled to an excuse. No man could grasp his great scheme and the possibilities of *The Metal Worker* at the same time.

H. SMOKE.

The July 19 issue of the Canadian *Hardware and Metal* of Montreal and Toronto is a special stove and

heating number. Our contemporary has shown much enterprise in collecting information relative to the stove and kindred interests of Canada, indicating the flourishing condition of business in the Dominion. We observe that the columns of *The Metal Worker* have been drawn upon to some extent. This is gratifying, but our gratification would be increased if proper credit had been given for all the matter thus taken. The article on "Handy Furnace Rules and Calculations," specially prepared for *The Metal Worker* by James A. Harding, appears, we regret to see, as if it had been written for *Hardware and Metal*. We trust the omission of credit in this instance was an oversight.

A FURNACEMAN'S REPUTATION.

BY J. S.

Having borne the brunt of the strain that is felt by every man who endeavors to do only good furnace work I am thoroughly conversant with the temptation which confronts many a furnaceman when he is asked to stamp with his good name furnace work that does not measure up to his ideal, or to his standard. A little financial stringency, caused by bills falling due or some other equally potent influence, tempts some men to grant the requests for cheap prices and cheap work from men who have no interest in the final welfare of the purchaser or the trade. Having a shop in a large city with a large suburban district, I have succeeded in the past 20 years in building up a custom furnace trade by doing the best work that I knew how in every instance and charging a price in accordance. Had I not thoroughly mastered hot air furnace heating I should not have been able to satisfy my customers in such a manner as would enable me to secure a satisfactory profit on every job. In spite of the active canvass for steam and hot water heating apparatus made by salesmen and representatives of the local heating contractors, I have had for the past two years all the work that I could do, without solicitation. I frequently secure customers who have been recommended to me with the statement that my work may cost a little more, but that without question the final result will be satisfactory.

This preface to a little episode is not given from egotism, but rather to more forcibly illustrate how some operation builders and other unprincipled people will impudently ask that such a reputation be sacrificed for their pecuniary benefit. In the case in point, a man who was building a dozen fairly good houses invited me to give him a figure for heating them. After getting it he asked me the price on a 36-inch furnace, my price having been made on a 44-inch furnace, which the houses needed to be satisfactorily heated. On being told the price he asked whether I could not put in the smaller size of furnace so that the cost would be within the figure which he desired to pay for the work, and which had been made by a competitor who has not yet established a reputation, and who is satisfied with a small profit in hand.

I asked him to whom complaint would be made if the furnaces failed to satisfy the purchasers, and whether he would in any way suffer by it. He replied that he would not, for if the buildings were sold he would have no interest in the question. I asked him how he thought the matter would affect me, and he shrugged his shoulders. I then told him that under no consideration would I put into those buildings, or any others, a furnace heating system that, according to my judgment, would not be of sufficient capacity and contain a heater of a size that would give satisfactory service. He was quite disgusted at what he called my pigheadedness in turning down an order and a profit which I could make in the interest of people that I did not know and might never see.

This little episode may interest furnacemen who are invited to allow their reputation to be put to the base uses of men who have no interest in their welfare, and it may encourage less experienced furnacemen to take the proper stand should they be approached in a similar manner. If it does, I shall feel that my contribution has not occupied space without advantage.

Shop Conditions.*

BY HUGH M PHEE, BRIDGEPORT, CONN.

Taking the average foundry of the present day, generally speaking, we find conditions existing that are not creditable to either employer or the foreman in charge. A lack of interest, it seems to me, is the cause of this. The molder and apprentice, in my estimation, should not be held responsible for this, for we find that the improvements in all the other departments of great manufacturing concerns result in benefit to both employer and employee. Unfortunately these results are not met with in the foundry. Not that less work should be done, but ways and means should be provided to increase the efficiency of a shop. This, I think, can only be done by a combined effort on the part of the employer and his foreman to make the conditions such that the employee can have a place to work in that will give him heart and interest to do better than he ever did before.

Take the molder who commences at 7 a.m. As he strips for work, he hangs his clothes on a spike driven into the wall as near his floor as may be convenient. Many times these clothes drop to the floor, and no one bothers with them. Now he finds his flask shaken out during the night, but must tear the castings out of the sand, wet this down, get his shovel and temper his sand pile so that he can commence to mold. By the time he is ready to mold a day's work he is played out, but by dint of practice and the necessity of doing so he labors on with only one outlook before his mind—quitting time.

Now we know that things are usually severe enough to bear even with the best of conditions, for we all have had more or less of just this experience. Believing that a remedy is absolutely necessary, let us look at the conditions prevailing in the machine shop and the pattern shop. A machinist has a specified machine to operate, with helpers conveying the castings to be finished to him, keeping him supplied with material to perform his share of the production. Producing finished work gives him an interest in it which is of benefit to his employer. The same holds true in the pattern shop. The pattern maker has a bench to work at. His lumber is brought to the shop, laid down convenient to the saw and planer. He can get his material without any special exertion; in fact, everything is placed for him in such a way that he has only to perform the work that his trade demands.

Now, why cannot we have some such conditions existing in the foundry? This is in itself a less despicable place to work in on account of the dust and dirt. Have a place for each man to hang up his clothes in, so that he can wear good ones. Have his floor in the same condition as the machinist has his—ready to begin work on. Let helpers prepare his sand pile so that he can commence molding and not act in the capacity of a laborer the first two hours of the day. Let his castings be shaken out for him, his flasks be fixed up. He can then put in eight hours molding instead of six, and get out superior work and much more of it.

May this effort to present the subject in a somewhat different light result in awakening the interest of my foundry colleagues, and some action be taken toward the improvement of the conditions surrounding the molder. Then the trade will receive greater recognition everywhere and stand second to none.

In presenting to the attention of the trade the merits of the Dighton Oak Furnace, the manufacturers, the Dighton Furnace Company, Taunton, Mass., state that the general type of construction is the same as their regular Dighton, which has established such an enviable reputation among dealers and house owners generally. The Dighton Oak is made especially for burning wood, but is also well suited for coal, coke or gas, according to circumstances. The wood grate is not fastened to the fire pot or coal grates, but rests upon the triangular grate bars. By turning these bars the circular flanges on the under side come in contact with them just enough to thoroughly clean the fire. If at any time it is desirable to use coal, instead of wood, as a fuel, the grate can be instantly removed through the feed door.

* Read before the American Foundrymen's Association, Boston, June, 1902.

TAKE A LOOK AT THIS STOVE.

BY I. C.

Some of the readers of *The Metal Worker* may be interested in a scheme which I have found successful for attracting attention to the stove store at the proper season. It resulted in my store being the talk of the town and the securing of visitors who made purchases, bringing business that would otherwise have gone elsewhere.

Like most other stove dealers, I possessed a very dilapidated relic of former usefulness in the shape of a flat top cook stove with a reservoir. In order to make this stove assume the red, rusty look of abandonment I had given it one or two coats of vinegar, which had the effect of ripening the rust most beautifully. While this preparation was going on I made a large, square transparency, such as are most frequently seen in parades during Presidential campaigns. On the four sides of this transparency I placed the words, "Take a Look at This Stove." I arranged it so that it was lighted at

Take a Look at This Stove.

night. In the bottom of the fire chamber, in the bottom of the ash pit, in the bottom of the oven, under the top covers, and in the bottom of the reservoir, I placed cards bearing these inscriptions:

"You Would Not Want a Stove Like This. You Can Buy a Better One Inside."

"Is Your Stove a 'Has Been' Like Me?"

"Did You Ever Study the Conveniences of the Twentieth Century Cook Stove in the Store?"

"The Good Things of To-day Beat the Old-Fashioned Things of our Grandads."

The condition of the stove and the banner brought old bachelors and school children and lots of other people who had no particular interest in that old stove to take a look at it, for the curiosity of the original savage seems to have developed wondrously with civilization. Yet people noted for their neatness took the trouble to soil their hands and clothes in lifting off the covers, opening the oven doors and looking into the reservoir and ash pit to see if there were any more cards that they had not read. A good big percentage of them came into the store to have a talk about the enterprise of such a scheme.

I would say to any stove man who thinks he is excessively busy and is cranky and fussy in his treatment

of customers, "You don't want this sort of attraction in front of your place." On the other hand, if he has a bright young salesman with some geniality in his make-up, he can turn these visits to account and sell all sorts of odd stock by bringing it to the attention of the curious when they are in an investigating frame of mind. That old stove at the front of my store is worth to me any two of the finest ranges with nickel trimmings, oven thermometer, and all the rest of the gewgaws that the stove manufacturers have crowded upon stoves now, that I have on my sample floor.

The Kernan Shell Bar Grate.

One of the important constructive features of the Welcome warm air furnaces, which are manufactured in a variety of sizes by the Syracuse Stove Works of Syra-

The McClary Mfg. Company's Proposed Enlargement.

We learn from the *Canadian Hardware and Metal* that the McClary Mfg. Company, who are large manufacturers of stoves, ranges and furnaces at London and Hamilton, Canada, have purchased in London the whole block of land inclosed by William, Nelson and Adelaide streets and the river, and a large parcel of land east of Adelaide. Within the block mentioned they will construct a series of buildings, wherein something over 400 men will be employed. This will rival in extent their immense establishment on King, Wellington and York streets. To carry out the proposed arrangements Trafalgar street will be closed. The plant will comprise a molding shop, mounting shop, power house and storage, a polishing shop and other smaller buildings.

The Kernan Shell Bar Grate.

cuse, N. Y., is the Kernan shell bar rotating and revolving grate, a general idea of which is afforded by means of the accompanying illustration, which represents the grate as it appears when dumped. The construction is the result of long and severe tests and the company state that for the first time in the history of heating apparatus they are able to furnish a grate of the shell bar construction, which allows the air on all sides to pass into and through the bars, giving to them on their three sides a fire surface which, it is claimed, causes a thorough combustion in the fire pot and at the same time, by the cooling effect of a complete circulation of air, preventing the bars from twisting or warping. The point is made that the Kernan grate bars are, without bolts, suspended within a removable frame, the construction being such that the grate frame or any bar may be easily replaced through the ash pit door. By reason of the perfection of combustion accomplished there are no clinkers, and, as a consequence, an economical consumption of fuel results.

The foundry will be about the largest in Canada, 200 x 230 feet. The mounting shop will be 75 x 300 feet, and the other buildings will be of proportionate dimensions. The plans have already been prepared, and the buildings will be thoroughly modern in construction and equipment.

The new plant is directly across the road from the rolling mills that are to be erected by John White & Sons, and both places will be on the new belt line that is to connect with the London & Port Stanley Railroad, by means of which the new enterprise will be brought into close touch with outside markets. The McClary Company intend to build also a subswitch that will run from the belt line right into the heart of their new establishment.

THE directors of the Shelby Stove Company of Shelby, Ohio, have voted not to accept other propositions, but continue in Shelby and increase the capacity of their plant by installing new machinery.

ADDITIONAL CLAUSES TO MOLDERS' CONFERENCE AGREEMENTS.

Following are the clauses added this year to the conference agreements in force between the Iron Molders' Union of North America and the Stove Founders' National Defense Association:

Clause 16.—The general trend of industrial development is toward employing skilled labor, as far as practicable, at skilled work, and in conformance with this tendency, every effort should be made by the members of the S. F. N. D. A. and the I. M. U. of N. A. to enable the molder to given seven hours of service per day at molding, and to encourage the use of unskilled help to perform such work as sand cutting and work of like character, when the molder can be given a full day's work.

Clause 17.—Inasmuch as it is conceded by the members the S. F. N. D. A. that the earnings of a molder should exercise no influence upon the molding price of work, which is set, according to well-established precedent and rule of conference agreements, by comparison with other work of like kind, the placing of a limit upon the earnings of a molder in the seven hours of molding should be discountenanced in shops of members of the S. F. N. D. A.

Clause 18.—Molders who may be employed as "cat skimmers" should receive at least the minimum rate of day wages prevailing in the stove plate foundries of the locality, but should they earn more than the minimum rate, computing the value of their output at the piece price rate, they should be paid the piece price rate.

Clause 19.—When a full floor of new work is given a molder he should be guaranteed the day work rate of pay for the first day, in order that he may be given an opportunity to get the job in good running order for piece work; if, however, the molder should earn more than the day work rate he should be paid his full earnings.

Clause 20.—Where a change of job is made the molder often loses considerable time and is put to great inconvenience through the necessary clamps, boards and other facilities needed for the job not being supplied to him promptly. We believe that in well regulated shops that should be made a feature of the shop management and should be a subject of favorable recommendation to the members of the S. F. N. D. A.

Press dispatches from Toronto state that the convention of the Iron Molders' Union decided against increasing the ratio of apprentices in stove foundries.

Monarch Gas Heaters and Ovens.

The American Stove Company, Monarch Division, Mansfield, Ohio, have issued from the press an exceedingly neat and attractive catalogue, illustrating and describing the Monarch heaters and asbestos lined ovens, which they are manufacturing in many varieties. The heaters are intended for using either natural or manufactured gas and embody features which cannot fail to command the attention of the wide awake and enterprising dealer. The Monarch Ventilator No. 164 has been improved for this season by the substitution of cast iron in the fire box section in place of sheet steel, the intense heat generated making this change necessary. The stove is fitted with two 15-inch burners, having four rows of gas orifices in each, which, it is said, produce such intense heat as to quickly set the incandescent brick clinkers glowing. The Monarch Triplex, an original and powerful heater of the tubular variety, has three 6-inch Russia iron radiator pipes, within which are located smaller tubes, each flattened at the lower end, forming the back walls of the burners. The Monarch combination heaters are in effect a combination of an open fire place and a radiator. Various other lines are shown, including some new patterns of the radiator type, as well as hot blast water heaters, asbestos lined ovens, &c.

J. ALLISON ORR of the Mt. Penn Stove Works, Reading, Pa., was one of the out of town Stove men in New York City this week, making his headquarters with J. M. Litchfield at the corner of Beekman and Pearl streets. Mr. Orr reports that his foundry is running with the usual summer regularity and that the popularity of the Mt. Penn line is reflected in the orders which are being sent in, although the coal question is now beginning to have an influence on the buying.

Mueller Furnaces in the East.

The L. J. Mueller Furnace Company of Milwaukee, Wis., report quite a favorable outlook for the sale of their heaters in Philadelphia. Their agent at that place, John S. Makin, formerly of the Makin-Kelsey Company, reports very satisfactory results in heating with Mueller furnaces some of the largest and finest residences in Philadelphia and vicinity during the past year. Mr. Makin is now installing a hot air heating plant, using a Mueller furnace, in the residence of ex-District Attorney George S. Graham at Bryn Mawr. This residence is one of the largest and handsomest erected in that section for some years. Mr. Makin also has contracts for installing heating plants in the new residences of C. Z. Hoag at Haverford, and H. D. Justi. The latter named is well known throughout the United States as one of the largest manufacturers of dental goods. During the 25 years that Mr. Makin has been in the heating business he has installed plants in over 2000 buildings in and near Philadelphia, and he styles himself "The Long Distance Heater Man." He is one of the pioneers in using the "battery system" of warm air heating by gravity in the State of Pennsylvania.

The Union Stove Works.

We have received from the Union Stove Works, 70 Beekman street and 66 and 68 Gold street, New York City, a copy of their stove catalogue for the season of 1902 and 1903. In offering this publication the company refer to it as marking another step forward. They point with pardonable pride to the continued increase in their business, due to the quality of their goods and a careful and constant study of the requirements of the trade. The printing is in black on a delicately tinted paper, while the binding is in flexible covers of neat design. Something over 60 pages are devoted to cook stoves and ranges, prominent among which may be noted the Bronx, a new range intended for using either coal or wood as a fuel. It has five boiler holes in the top surface, is made in two sizes and is ornamented in a neat and effective style. The Yukon, a six-hole range, is one of the later additions to the company's extensive assortment and embodies the modern features. Another novelty is the Astor No. 50 range, designed especially for use in flats and apartment houses. It is made in one size only and in portable form. The hot water circulating boiler is of the rivetless horizontal type, so as to economize in floor space. The stove is also fitted with patent swing gas cooking attachment for use when the weather is such as to render this form of fuel more convenient than coal. Double oven Astor ranges, adapted to meet larger requirements than that of the stove just described, are also considered. The Astor No. 80 is a new pattern made with six 8-inch holes and offered in portable form, as well as adapted for brick setting.

Among the heating stoves, the Flirt occupies a prominent place, as it has for many years past. The great popularity of these goods has led the company to offer the Angler, a new square base heating cylinder parlor stove, and the New Joy, a direct draft construction with draw center grate. These patterns embrace the many features originated and introduced by the company in cylinder stoves, together with devices which heretofore have been confined to the cast iron parlor stove class. All sizes, except Nos. 9 and 16, are made to take magazines, thus rendering them self feeders. Various other lines of heaters are shown, including the Rush, a new direct draft parlor stove, globe, cannon and laundry stoves, Baltimore heaters, Storm King and Commander furnaces, Astor hot plates, various forms of gas stoves and ranges, gas radiators, sad iron heaters, Lakewood oil heater, hollow ware, &c. The catalogue concludes with a price-list of brick linings, a table of approximate gross weights and cubic contents, created for export, of stoves, ranges, furnaces, &c.; code words and an index of stoves, alphabetically arranged.

Following these features attention is called to a new self feeding globe stove, which was brought out too late for classification in the catalogue. It is referred to

as a new idea in stove construction and is intended especially for offices, stores, elevated and surface railroad stations, saloons, restaurants, club houses, hotels, &c. It combines the essential features of the self feeding parlor stove with the large fire capacity of the globe stove, avoiding, however, the expensive parts of the parlor stove and the rough and uncouth elements of the ordinary globe stove. The result is a construction "highly artistic, of great heating power, moderate in price and absolutely different from any stove heretofore produced." It is made in four sizes and has fire pots 13, 15, 17 and 19 inches in diameter respectively.

Accompanying the catalogue is a price-list relating to the leading lines manufactured by the company. The matter is presented in a shape to be of the greatest convenience and value to the dealer, and gives evidence of having been prepared with special regard to the requirements of the trade.

ODD PLATES.

THE BRIDGE & BEACH MFG. COMPANY, St. Louis, Mo., have recently issued a circular letter to the trade in northern Illinois to the effect that their representative, John Le Page, was severely injured in a railroad collision on Saturday, July 12, and is now confined at the Cottage Hospital, Peoria, with a broken collar bone, which will prevent his traveling for a number of weeks. The company solicit mail orders from the trade addressed, for which Mr. Le Page will receive full credit the same as if taken by him personally. The company also state that any business with which the trade may favor them under the circumstances will be doubly appreciated by both Mr. Le Page and the manufacturers. We may add that as Mr. Le Page is one of the most popular of the traveling fraternity his customers will undoubtedly see that his interests do not suffer while he is incapacitated.

THE JOHN VAN RANGE COMPANY, Cincinnati, Ohio, call attention to the fact that their latest production in the way of Wrought Steel Ranges is the Pacific, which is made with six boiler holes in the top surface, high closet with rolling front, drop oven door, which forms a convenient shelf when open, and a fire box intended for using hard or soft coal.

THE CO-OPERATIVE FOUNDRY COMPANY, Rochester, N. Y., are offering many attractive patterns in the Red Cross line, which is referred to as combining "all the best features of modern Stove construction." The dealer is offered an extensive assortment from which to choose, whether it be in the way of Steel Ranges, Cast Cooks or Heaters. Among the latter may be mentioned the Garnet, a new medium priced base burner, offered in four sizes and as a single and double Heater.

THE BARSTOW STOVE COMPANY, Providence, R. I., point out that their Hot Air Furnaces are equipped with hot blast attachment. The gas ring around the fire pot is said to conveniently distribute a large volume of superheated air over the surface of the fire, this tending to complete a rapid combustion of the gases which usually escape through the smoke pipe. The claim is made that this form of construction also intensifies the heat from the fuel and prevents the formation of clinkers.

THE FRONT RANK STEEL FURNACE COMPANY, 2301 to 2309 Lucas avenue, St. Louis, Mo., construct the fire chamber in their Front Rank Hot Air Furnace in one solid sheet of closely riveted steel. It is lined above the fire limits with fire clay tiling, thus rendering it very durable. The radiators are large, with an uncommon area of heating surface in comparison with the size of the fire pot. The furnaces are built on vertical lines, the air coming into direct contact with the entire heating surface. Hard or soft coal or coke can be used as a fuel, according to circumstances, although the company also manufacture Furnaces for burning wood.

THE MICHIGAN STOVE COMPANY have issued Catalogue No. 32, which is supplementary to Catalogue No. 30 for 1901 and 1902, and is to be used in connection

with the latter book. Supplementary Catalogue No. 32 contains illustrations of new patterns only, with an index of the Stoves and Ranges of the Garland line.

CHAUNCEY CASTLE of the Comstock-Castle Company, Quincy, Ill., and president of the Stove Founders' National Defense Association, sailed last Saturday on the "Campania" for a European vacation trip.

THE trade will regret to learn of the death of J. W. Dow, treasurer of the Novelty Mfg. Company, manufacturers of Oil Stoves, at Jackson, Mich., which occurred on Thursday, July 17, after a brief illness.

HENRY GLEASON, who is known to Stove manufacturers everywhere, paid visits to the Stove trade in New York City this week, introducing A. T. Matthews of the Matthews Mfg. Company of Worcester, Mass. As they were giving confidential information about some new things in the Stove Trimming line, it is probable that the burden of their information will be disclosed to the general public in due season.

J. Q. A. BUTLER of New York City, who has been in the Stove business for 52 consecutive years, has left his Beekman street salesroom in the charge of his son while he is enjoying his usual summer vacation at Montrose, on the Hudson.

CONTRACTS have recently been let by the Pioneer Stove Company of Columbus, Ohio, for a warehouse and office building to be erected immediately west of the power station of the Columbus Railway Company on West Spring street. The new building will be of brick and will cover an area 75 x 200 feet. About half the structure will be three stories in height, while the remainder will consist of one story and a basement. A wing will be added to this building, extending to the north, and later a similar wing on the west end. It is expected to have the improvements completed by September 1.

THE M. & D. RANGE COMPANY, Lake street, Chicago, have adopted an effective way to call attention to the M. & D. Gas Ranges. They have issued a little booklet containing 100 recipes of good things to eat, how to make them, and how to cook them. Among the good things are illustrations of the M. & D. Low Broiler and Elevated Broiler, Gas Ranges with water heaters, as well as Combination Ranges for coal and gas or wood and gas.

THE DANVILLE STOVE & MFG. COMPANY, Danville, Pa., have recently made a large shipment of Stoves to Honolulu, the consignment consisting exclusively of a Wood Cook known as the Hustler. The company have been doing quite an export business lately, shipping their goods to different South American and West Indian ports, as well as to Japan. The latter country is a new field for them and we understand a good business is in prospect. About two weeks ago the company sent to Japan a number of Prince Beaver Stoves, a construction which is very popular with the local trade and which, it is thought, will meet with a good demand in its new field.

THE THATCHER FURNACE COMPANY, 240 Water street, New York, are keeping up a correspondence with the trade interested in Furnace heating. They have just supplemented their little folder, entitled "Heating Arguments," with a letter stating that others have made money pushing the Thatcher Tubular Hot Air Furnace, and that it has a reputation for good work extending over a period of 52 years, so that it is now known by the best architects and builders, who use it with confidence. Its features of large heating surface, economy and satisfactory operation are also mentioned. The trade who are looking for the best thing in the Furnace line are invited to investigate it. The letter closes with the suggestion, "Do it Now."

A VERY attractive catalogue of 48 pages, which has just been issued by the H. Adler Company, 241 First avenue, Pittsburgh, Pa., sets forth in pleasing style the merits of their Acme, Lustre and Duquesne Stoves, also their line of Gas Ranges, Cookers and Ovens. Many

new and handsome designs have been added to the company's already extensive assortment, these embodying the latest improvements. Among the recent additions may be mentioned the Relda, a neat design of cast front closed Stove, with center tube arrangement, which is offered in three sizes; the Iona-Acme Gas Range with closed top, for using natural gas, made in two sizes; the Lustre Backwalls, designed for open grate fire places and made entirely of stamped steel, upon which is placed asbestos fiber, and the Iron City, an improved design of open front construction intended for using natural gas as a fuel. The text appears in two colors and the arrangement of the catalogue gives evidence of careful attention to the wants of the trade.

THE SIMPSON STOVE & MFG. COMPANY, Pittsburgh, Pa., are sending out a folder printed in colors, bearing upon the front page a picture entitled "Almost is Not Quite." It represents a fierce looking bulldog straining at the full length of his chain to secure a roast chicken which is temptingly displayed a few inches beyond his reach. The text within the folder bears the same title, but relates to business matters instead of roast chicken. The statement is made that the business the dealer does not quite secure is not doing him any good. What every man needs is the goods that clinch the sale—the goods that are so attractive people cannot get away from them. The inference to be drawn from what follows is that if Simpson Gas Ranges, Hot Plates, Ovens or Cookers are put in competition with any other goods of the kind the sale is made. As the company put it, "Merit, distinctive features and good talking points do the business." The company request those interested to send for catalogue and prices which they have issued relating to their goods.

FLOYD, WELLS & Co., Royersford, Pa., are distributing among their friends in the trade an interesting little pamphlet bearing upon the Bengal Furnace, which they manufacture in many varieties. Attention is drawn to a few commonplace points in regard to setting furnaces, after which the Bengal Heaters are described in a way to interest not only the dealer handling the goods, but the house owner who is thinking of installing a heating apparatus in his dwelling. The method of operation is interestingly described and the essential parts of which the Bengal consists are clearly illustrated. Attention is also invited to the Rosemont Radiator, which is referred to as economical in first cost as well as in operation. The large catalogue which the company have compiled for distribution gives a great deal of information of general interest to the furnaceman.

Sidney Shepard & Co.

The last of June witnessed the removal of the offices of the Buffalo Stamping works, of which Sidney Shepard & Co. are proprietors, from those previously occupied adjacent to their Clinton street plant to their new plant, which has been in the process of erection during the past year, in the southern section of the city on the line of the Erie Railroad. The company purchased a large tract of land and proceeded to erect an entirely new and modern plant for the manufacture of their extensive line of sheet metal goods. A large six-story warehouse, in which six freight cars can be loaded or unloaded at once; an enameling department covering the length of a city block, and one of the main factory buildings, together with fire proof storage rooms, boiler house, &c., have been completed, and are now fully occupied and equipped. Contracts were let last week for the second group of factory buildings, two five stories high and one six stories high, which will be ready for occupancy during the coming winter. All of the buildings of this new plant are of massive slow burning construction and embody in arrangement, construction and equipment the latest ideas and developments in connection with the manufacture and handling of this class of goods, which includes enameled ware, stamped, pieced and japanned tinware, galvanized ware, sheet iron ware, copper ware, aluminum ware, &c. Each department is run independently by its own electric

motor driven by Niagara Falls power, and the entire plant is brilliantly lighted by electricity from the same source. A most elaborate system of automatic sprinklers and fire protection has been installed and fire boat service is near at hand.

The new plant is especially well located, for besides side tracks on its own premises it is within ten minutes' carting distance of the main freight depots of all the great trunk lines centering in Buffalo and of the lake lines and Erie Canal. The old plant, employing 600 hands, is still being run to its full capacity and will continue to be occupied indefinitely, certain departments being removed and consolidated with similar departments at the new works, and the room thus made available occupied by enlargement of certain branches, which have been greatly cramped for space. The main offices and warehouse remain at 145-149 Seneca street, as heretofore, where the jobbing department of the business is carried on, as this house is one of the oldest and largest handlers of sheet iron, tin plate and kindred supplies in the country. The recent establishment of a house in San Francisco makes eight exclusively wholesale establishments from which the goods manufactured and sold by the firm are distributed—namely, New York, Buffalo, Chicago, St. Louis, Kansas City, Denver, San Francisco and Seattle.

Pennsylvania Retail Hardware Dealers' Association.

A special meeting of the Pennsylvania Retail Hardware Dealers' Association was held at the Monongahela House, Pittsburgh, on the 7th inst., President Moore presiding. C. H. Miller, chairman of the Insurance Committee, made a report, after which Mr. Simpson of Huntingdon was listened to on the subject of "Mutual Insurance." On motion of Mr. Bowers, seconded by Mr. Hegner, the report of the Insurance Committee was adopted. On motion of Mr. Miller, seconded by Mr. Byers, the second section of the by-laws was amended so that the admission fee to membership shall be \$6 in advance, which fee shall cover all dues until the next annual meeting. President Moore appointed an Entertainment Committee comprising J. H. Bowers, A. Q. Casselberry and W. H. Taylor.

After a recess for lunch the meeting reconvened in the afternoon. Samuel McKnight having positively refused to serve as a member of the Executive Committee, L. C. Fox was appointed by the president to fill the vacancy.

The salary of the secretary was placed at \$300 for the current year, contingent on sufficient funds being received to pay that amount.

The following persons were elected as directors of the Pennsylvania Hardware Mutual Insurance Company: C. H. Miller, Geo. L. Moore, Mr. Thompson, S. S. Bryan, C. J. Kirk, J. E. Digby, Geo. W. Hackett, J. H. Bowers, A. M. Gregg.

The following Legislative Committee were appointed by the president: S. S. Bryan, J. F. Frye, H. F. Robinson, John W. Seaman, J. B. Holderbaum.

On motion of Mr. Miller, seconded by Mr. Fox, ten members of the association shall constitute a quorum for the transaction of business. The meeting then adjourned.

THE WEBBER-AYERS HARDWARE COMPANY have succeeded the Webber-Seeley Hardware Company and the Ayers Hardware Company at Fort Smith, Ark. The following are the officers of the company: Walter Ayers, president; W. W. Webber, vice-president, and John Ayers, secretary and treasurer. The company have been organized with a capital of \$150,000, \$142,500 paid up, and will do an exclusively wholesale business in Hardware, Shelf and Heavy, Stoves, Tinware, Agricultural Implements, Sporting Goods, Wagons, Buggies, Coal Miners' Supplies, Pipe and Fittings, Belting, Packing, &c. Ayers & Co. will continue to do a retail business in Hardware and related lines.

M. L. MONTGOMERY has purchased the Hardware and Tinware business of Wm. Graham, Crelghton, Neb.

Improved Banner Oil Heaters.

The Plume & Atwood Mfg. Company, Waterbury, Conn., and 29 Murray street, New York, have put on the market a group of improved Banner oil heaters, one of which is here illustrated. What especially distinguishes this make of heater is the automatic safety stop which prevents the flame from getting above the safety point. Neither will it smoke or give off an odor when

Improved Banner Oil Heater, Size 3.

extinguished, because, as shown in Fig. 2, the stop nut A limits the upward movement of the flame spreader B and the flame spreader B limits the upward movement of the wick. The wick, whether raised or lowered, always has a metallic rim resting on the top of it, the flame reaching the oil as it follows the wick upward at the side of the wick instead of directly on top, as is customary. Thus when the wick is raised for lighting the rim rests on the top and keeps it even, and when lowered to put out the flame is instantly extinguished, as the wick is then inclosed by metal both top and sides. The founts, which hold variously 3 pints, 1-gallon and

Fig. 2.—Burner with Automatic Safety Top.

2 gallons of oil, have an automatic filling indicator, by means of which the amount of oil in the fount is shown at any time from one-quarter, one-half and three-quarter full to entirely full. This is accomplished by means of an air tight float that in rising turns a partially twisted rod that moves the pointer at the top. The heaters can be supplied in different sizes, which for the purpose of approximating size are, roundly speaking, 19¼ inches high, with 6-inch drum, others being respectively 23, 25, 26½ and 33 inches high and proportionately larger in diameter. The smaller one has a 5-inch round wick,

the largest a 12-inch round wick and the three intermediate sizes 9-inch round wicks. All have wire balls for carrying and tip backward for lighting but one which is contained in an ornamental four-leg cast iron frame, something like a brass parlor table, and has a cast iron top. They are finished in japan and nickel.

The Savin Ice Pad.

A new invention for reducing the consumption of ice in refrigerators and ice boxes is illustrated herewith. The device consists of a chemically treated felt pad inclosed in galvanized iron wire. It is claimed by the manufacturers that it will absorb the odors arising from the ice box and prevent the usual occurrence of slime on the side wall. A saving of 33 1-3 per cent. in the consumption of ice is claimed by the company. Practical demonstration has shown that the temperature of a refrigerator is lowered several degrees with the use of the pad and that ice of the same weight will last much longer than in a box without the pad. The manufacturers state that there is nothing injurious in the pad and that water percolating through it can be used with perfect freedom. In use the pad is placed on the bottom of the ice compartment and the ice placed upon it, as shown in the illustration. The pads are made to fit any

The Savin Ice Pad.

size box, it being necessary, however, that an inch air space be allowed on each side for free circulation of air currents. The only precaution to be observed, it is remarked, is that the pad should always be kept in a moist condition, for if allowed to become dry it loses its chemical properties. The Savin Ice Pad Company, 1317 Columbia avenue, Philadelphia, Pa., are the manufacturers of the pad, which is now being placed on the market.

Sherwin-Williams Company.

The Sherwin-Williams Company, Cleveland, Ohio, are distributing an especially attractive counter book relating to their various paints and varnishes, also booklets, one of which is designed for the iron trade, while the other relates to Metalastic, their new product for metal surfaces. This is the company's old paint "P. M. 5" improved, retaining, it is stated, all the good qualities of the old paint with many improvements. It is referred to as a right combination of carbon, graphite and specially treated pure linseed oil for an elastic metal paint impervious to air and moisture. The company advise us that they have completed a large linseed oil plant and will soon begin crushing seed. They will not only make all the oil used by them in the manufacture of their products, but will also enter the general market.

The Tryon Wrench

Geisel Mfg. Company, Springfield, Mass., who are making a line of hardware specialties, are now making the Tryon patent wrench, having bought the patent rights from the inventor. The tool is made of cast steel, nickel plated, and is a combination of monkey wrench, pipe wrench, tap wrench, bicycle wrench, drill brace and vise. The company state that there is no "give" to the jaws of this wrench, and that each feature of the tool is individually strong. It is referred to as a handy implement to have in the house, office or store, or to carry in a buggy, wagon, automobile or yacht, and as belonging in every mechanic's kit. It is made in five sizes, the largest size being 10½ inches in length.

TRAPPING WASH TRAYS AND SINKS.

BY D. F. N.

A great deal has been said at various times about devising some better method of trapping and running the waste pipe for a set of wash trays. From a practical point of view, the horizontal waste pipe under the wash trays should run on the wall at the rear of the sinks, the branches being taken out for the tub connection. The plugs in the tub should be connected with bent couplings and the pipe from these couplings should run into the waste line with a Y branch. This would prevent the waste pipe from being dented and mashed by pushing

Trapping Wash Trays and Sinks.—Fig. 1.—A Recommended Method.

small vessels or other articles under the tray. Such a connection has another advantage to be considered, which is this: In my experience I have never met with a case where it was necessary to remove an old trap and replace it with a new one under a sink where the waste pipe from the laundry trays was connected into the heel of the trap, as shown in Fig. 1. When the connection is made as shown in Fig. 2, it is not uncommon, particularly when the vent pipe is taken off short out of the crown of the trap, for it to become choked with grease and slime, which eventually congeals, making quite a solid and complete plug 4 or 5 inches long in the vent pipe.

The best way to arrange the work is that shown in Fig. 1, and it gives the least trouble to the plumber in its

Fig. 2.—A Faulty Method.

construction. This plan allows the 2-inch vertical waste pipe to be run in the partition behind the tubs or sink, leaving a branch at a proper height to receive a half S trap from the sink, and the waste pipe from the tubs to be connected into the heel of the trap. Of course, the vertical waste pipe should run up back of the sink and the trap be connected into it, instead of being extended along as shown in Fig. 1, which is presented in that way so that the principle involved can be better understood. By this arrangement the bent couplings at the tub will cause a sufficient fall to allow the water in these pipes to drain into the waste and that into the trap at the sink, so keeping these lines free and clear of water. At

the end of the waste, under the tubs, a clean-out screw can be placed which can be opened whenever necessary to clean out these pipes. The branches from the bottom of the tub can be readily cleaned from the inside of the tub.

Such an arrangement will enable the waste pipes to be properly trapped, while it also provides for the removal of any obstruction that might occur in them. This method of arranging the piping would also allow the tubs to be removed or replaced, also the sink, by one plumber, without help, should occasion require, and the waste pipe would not be in the way in handling the work. Fig. 2 shows a method of arranging the piping which would be in the way in case the tubs had to be removed. It also shows an improper method of running the waste and vent pipes, which is conducive to stoppage through the accumulation of soap and grease.

Proposed Tube Mills at McKeesport.

For some months officials of the National Tube Company have desired to acquire a large site of land at McKeesport lying between the present National Tube Works and the rolling mills of the Monongahela Steel Works. The parties who owned this land refused to accept a fair price for it, and the officials of the National Tube Company had practically dropped the matter and were making plans to build another tube mill at another point. The business interests of McKeesport then took the matter up and agreed to secure the land at a price fixed by the National Tube Company and the latter agreed to take the property if it was secured at the figures they offered for it. This company have succeeded in getting all the ground at the desired figures, with the exception of two parcels, and the National Tube Company will treat with the owners of these two parcels of property themselves. The ground comprises 28 acres and will be used by the National Tube Company in the building of large tube and other mills and also in extensive additions to their present plant. No definite announcement has been made as to the details of the plant to be built, nor will it be until certain matters now pending have been adjusted.

How to Set Fuel Oil Burners.

An expert in the South, says *Popular Mechanics*, who has made a study of using fuel oil to best advantage sends us the following regarding the location of the burners under an ordinary return tubular boiler:

For a 60-inch boiler place two burners, usually in the center of the ordinary doors and half way from the boiler to the grates. Let the inner ends be flush with the inside of the front wall.

Cover all grate surface with 1/4-inch asbestos board, except the equivalent of about 64 square inches to each burner, and immediately under the same. On top of this place a full layer of fire brick on the flat. Do not lay them too close, but allow a little for expansion. Plaster this over with fire clay. At a point about 36 inches from the point of the burner lay a cascade wall one brick length in thickness. Set these on edge. Leave 1/2-inch spaces. Run this wall up to within as near 4 inches of the boilers as the courses will make. Leave more rather than under 4 inches. Follow the circle of the boiler as nearly as convenient and set the brick up in a little fire clay to steady them. In case the bridge wall is as much as 12 inches from the boiler, lay one course on edge around this. Keep the pit behind the bridge wall empty. Stop all holes in the furnace walls and breeching. Put brick filling in the fire doors, leaving a loose brick near burner for lighting and observing the fire. Leave the ash pit doors in place. Direct the nozzles of the burners slightly downward so that they will strike the cascade wall about one-third of the way from the bottom.

The cascade wall serves very important purposes—first, for storage of heat and then radiating it or giving it out and thus perfecting combustion which might not otherwise be complete, as any unconsumed gases could scarcely get through the small spaces in the highly heated bricks of the cascade wall without being burned.

"How Best to Heat Our Homes"

A favorable impression cannot fail to be made upon people contemplating the erection of luxurious homes by the little pamphlet under the above title, issued by the Gurney Heater Mfg. Company of Boston and New York. It consists of 32 pages printed in black and sepia and bound in a dark drab cover having an embossed design in green and gold and a border consisting of a vine in green having flowers in full bloom in gilt. The first page of the pamphlet presents a sectional view of a building heated by a Gurney hot water heater, and the text opens with the statement that of all the world the American home life is the nearest approach to the ideal, not only because of the civic and social conditions, but also owing to the attainment in the arts and sciences. It treats of the evolution of the heating problem, until its culmination, which is claimed to be effected in the Gurney line of steam and hot water heaters. Fine half-tone engravings are used to picture the beautiful residences of some who have purchased the Gurney heaters, also views of libraries, churches, court houses, hospitals, hotels, apartment houses and a United States Government barracks in which the Gurney boilers are giving satisfaction. The text explains the features and construction of the Gurney apparatus in an entertaining way, and shows the Doric, the 400 Series, the Bright Idea and the Heavy Duty Bright Idea boilers by means of general and broken views. A number of illustrations also display the fine line of Duet, Tremont and Narrow radiators made by the concern. The Gurney Heater Mfg. Company leave no effort unexpended that will aid the heating contractor in effecting a sale of their goods, and the distribution of this last example of the printer's art can but have a beneficial effect in that direction.

Exhibition of Vacuum Heating and Valves.

Invitations have been sent out to steam fitters and heating contractors in the vicinity of New York to visit the salesroom of the Judson A. Goodrich Company, at 107 Beekman street, New York City, where E. P. Allen, representing the Norwall Mfg. Company of Chicago and the James A. Trane Vacuum Heating Company of the same city, is making an exhibition of the specialties of these Chicago concerns. By means of special apparatus Mr. Allen shows, so that all who visit him can readily understand and see, the construction and operation of the Norwall automatic air valve under actual working conditions. Those who are interested in vacuum heating systems can observe, by means of special apparatus, just exactly how the Trane vacuum heating system operates. Mr. Allen, who has been in New York since Tuesday afternoon, has had many interested visitors. He will remain until Monday night with his apparatus in continual operation, for the benefit of those who desire to study its features.

The Drake Series "C" Acetylene Generator.

The International Heater Company, Utica, N. Y., have issued a 20-page catalogue, printed in two colors, and having a green cover, on the front of which is an embossed panel in which the words "Drake Acetylene Gas Generator, Series 'C'" appear in red letters. The first pages treat of acetylene, calcium carbide and the color of the light derived from burning acetylene. Its advantages over other methods of illuminating buildings and villages are presented, among which is the statement that it is as safe as a candle. The advantages of a generator of sufficient size and proper construction to insure cool generation and to prevent the deterioration of gas through heat are also carefully explained. The opinions of several eminent acetylene experts form another interesting feature of the catalogue. In reference to the Series "C" generator, the company claim that it represents the latest and best results of research and experience. It is made in a variety of sizes adapted for the smallest cottages as well as for larger buildings, factories, theaters, or towns and cities. It is pointed out that by the use of separate small charges of carbide there is a saving in both gas and water. The company's method of cleaning the gas furnishes it pure

and dry to the distributing pipes. An illustration of the apparatus is presented, accompanied by a full, detailed explanation of its construction and operation. Other views are also given with the object of making the generator more thoroughly understood, as well as a table giving full dimensions and prices. The catalogue contains views of the International Heater Company's plants at Utica, which is the home of the Drake acetylene generator.

A Gas Pressure Gauge.

Every acetylene piping system should be tested for leaks before the job is passed or left. This is easily done, says the *Plumber and Decorator* of London. The testing or pressure gauge is as shown in our illustration. This can be made by any one. A piece of board, a piece of $\frac{1}{4}$ or $\frac{3}{8}$ inch glass tube and two cocks are the chief materials required. The tube can be bent in a Bunsen gas flame. The divisions, or scale, marked with figures are $\frac{1}{2}$ inch each, but they count as 1 inch each, as the water line sinks as much below zero on one side as it rises above it on the other. The thick black line in the illustration is the water, and it is registering a 3-inch

THE METAL WORKER

A Gas Pressure Gauge.

pressure. This gauge is also used for setting the governor by.

For testing for leaks the lower cock of the gauge is attached to a branch or a bracket. All other branches are plugged or the bracket taps closed. The main service cock, probably in the gas house, is also closed, as it is only the piping and not the generator that is to be tested. Now put water into the gauge until it stands at zero in both legs. Open both gauge cocks, also the bracket tap (if the gauge is attached to a bracket). Blow into the upper cock until a 12 or 14 inch pressure is registered then close this upper cock. If the water line remains steady for 15 minutes the piping work is quite sound.

A Labor Exchange.

The Sanitary Specialty Mfg. Company, 55 and 57 North Clinton street, Chicago, who are noted for their enterprise and push, have instituted a new departure of a kind which promises to be very beneficial to the trade. The company have established and are now maintaining an employment department. If work is slack in a community and there are journeymen out of employment they can be helped to secure work by correspondence with the Sanitary Specialty Mfg. Company. On the other hand, if employers have a large amount of work and need the help of journeymen they may be enabled, by writing to the company, to be placed in communication with the right kind of men. The company require of the applicant, in addition to his name and address, information as to his age, those dependent on him, his qualifications and personal habits, as well as references

as to his character. This information is supplied to the prospective employer so that he may be furnished with something on which to form an opinion of the applicant. No charge is made by the concern for their services in this connection. The broad gauge policy of the Sanitary Specialty Mfg. Company displayed in this matter is highly to be commended.

The Huxley Valve.

In the accompanying illustration is shown a sectional view of the Huxley valve, made by the Howe Mfg. Company, 1105 West Main street, Louisville, Ky. This valve, it is claimed, is made of a metal that is well calculated to stand the highest pressures and of a sufficient thickness to enable it to be properly finished without reducing its strength. The bonnet screws on the outside of the throat of the valve, allowing a wrench of any size to be readily used without interfering with the packing nuts. The strength provided enables the valves to be removed from the pipes without straining the necks. It is also claimed that the valve can be readily

The Huxley Valve.

packed under pressure, rendering it especially efficient as a throttle valve. It is only necessary to open the valve wide to shut off the steam or pressure of any sort from the upper part of the valve stem, so that it can be readily packed. All parts are made interchangeable, so that repairs can be quickly made. In consequence, no matter how often the thread in the bonnet which guides the valve stem becomes stripped, repairs can be made without interfering with the use of the valve. Another feature is the ease with which a new valve seat can be put in. These valves are made in all sizes from $\frac{3}{8}$ inch to 3 inches. The house have recently issued a catalogue giving full particulars in reference to them.

Cooling a Laundry.

Only awaiting the arrival of a continued warm spell of weather for a thorough test, the new ventilating and cooling plant in the American Steam Laundry Company's building on South Division street, Grand Rapids, Mich., says the *Press* of that city, is complete and ready for operation. The system is unique in that it is the only plant of its kind in existence, having been devised especially for the needs of the institution by William H. Yeomeans, the engineer of the plant, after long study over the problem of proper ventilation in laundry buildings, and visits of inspection to ventilating plants in Cincinnati, Milwaukee and other cities. Preliminary tests have already been made, which bear out the calculations that the apparatus will reduce the temperature of the plant at least 15 degrees below that of the outer air, overcoming not only the prevailing temperature of the atmosphere, but also the heat given off by the gas burned in the laundry, and now Mr. Yeomans is waiting for the first coming of the heated period to give his device a thorough and conclusive test under conditions of actual torridity.

COOLS AND WASHES THE AIR.

The principle of the apparatus is simplicity in itself. All the air which is to come into the building is drawn by a huge, revolving fan through a screen of coke kept constantly moist and cool by a stream of cold water. This cleans the air of all dust and floating impurities, washes it and delivers it, cooled to a point far below its original temperature, to pipes which carry it to all parts of the plant, where it is discharged at a rate that will renew the air in the factory in about four minutes. In that time the gases given off in the operations of laundering, it is expected, will have no time to gather in appreciable quantities and instead of the operatives being compelled to labor in an atmosphere laden with wash day odors and superheated to a point decidedly uncomfortable, they will be more comfortable than if at work in the outer air.

DRAWING IN THE AIR.

In the center of the group of laundry buildings has been constructed a large air shaft through which all the air to supply the ventilating system is drawn by the big fan. This air shaft opens upon a room across the middle of which is the big filter of coke, inclosed in a framework of wood and wire grating. This filter is 12 feet high, 28 feet long and 18 inches thick, about 7 tons of coke having been required to build it, and extends completely across the room, making it necessary for every particle of air to pass through it. On the other side of the coke filter is the casing for the big fan, the casing being 17 feet in diameter. The fan inside is 120 inches in diameter, the blades being 60 inches wide. Whirling at the rate of 117 revolutions a minute the big, flat blades strike the air as it rushes in at the side of the fan from the filter and force it out more than 50,000 cubic feet per minute into the immense galvanized iron pipe 74 inches square, which opens into the system of ventilation pipes. The fan is driven by a special 32 horse-power engine.

WATER FROM DEEP WELL.

To insure the proper cooling of the air the company some time ago drove a 5-inch well 315 feet into the ground, where a stream of water ample in quantity and of 47 degrees temperature, only 15 degrees above the freezing point, was encountered. Several veins of water were encountered at lesser depths, but the company wanted water as cold as possible, and kept on until this stream which met all their expectations was struck. This water has a slightly mineral taste and is used for drinking purposes throughout the plant. It has been tested with soap for use in laundry operations and has been found to be no harder than the city water. It rises by gravity to a point 23 feet below the surface, a special pump bringing it to the ground level and sending $1\frac{1}{2}$ -inch stream to the top of the coke filter, where it is fed into a shallow trough through a perforated pipe at the rate of 125 gallons per minute. From this trough it overflows upon the intake side of the filter, dripping down and keeping the coke thoroughly moistened. The water drains out at the bottom of the coke screen, and it is the intention to conduct it to a sand filter, by which it will be cleaned for further use in the laundry.

RESULTS WHICH ARE EXPECTED.

The water being delivered on the coke at the temperature of 47 degrees, it is expected that the coke will be kept at so low a temperature that the air will be cooled to a point that will overcome the heat given off by the gas heated machines used in the laundry work and also overcome about 15 degrees of the outer temperature—that is, if the temperature outside should rise to 100 degrees, inside the operatives would be working in a temperature of 85 degrees; while in ordinary summer weather the rooms would be as cool as comfort would allow. From the ventilating pipe system there are six 22-inch openings on each floor, feeding in the cooled air at all points of the rooms, the foul air displaced passing out of the ventilators and the windows, which will be open in warm weather. It might be supposed that the air, passing through the moistened coke, would take up a great deal of moisture, but tests with the hydrometer have shown that the difference in moisture is hardly perceptible.

PNEUMATIC WATER CLOSETS.

BY HELMAR.

Pneumatic closets are a type of the siphon family of closets that depend for their siphonic action upon the sucking power of a partial vacuum below the bowl seal. Various kinds of construction will cause the necessary vacuum, and with some makes any kind of tank will answer. But the strictly pneumatic closet, the one most widely used, and of which the engraving herewith illustrates the principles, requires a tank particularly adapted to the purpose.

This kind of closet necessitates the use of two traps. The closet proper is made in earthenware with both single and double trap. The closet with one trap in earthenware, shown in the sketch, is perhaps more used than the other, but no other type of closet can be substituted for it without changing the under floor piping work, while any other closet can be substituted at any time without altering the roughing in if the two traps are in the earthenware.

The upper trap of these closets must not be vented, and no vent is provided by the makers. If the upper trap was vented no vacuum could be formed in the space between the two traps. The vacuum is essential; the closet will not work without it. It cannot be flushed by hand by pouring water into the bowl with a bucket. The bowl would fill and run over, because the air locked between the two traps will not allow the water to flow into the soil pipe. The air between the traps must be withdrawn before the bowl will discharge water properly, and the only way to do this is through the normal action of a tank made for the closet. For this particular reason pneumatic closets are not the best suited for use in country or suburban places where a plumber cannot be found quickly.

The lower trap of pneumatic closets must always be vented. Closets having two traps in the earthenware are fitted with a vent on the lower trap. When the closet with one vent is used, the plumber must supply one trap under the floor and vent it as shown in the sketch. If the vent on the lower trap is omitted the closet will not work after the first flush, because the volume of water in two traps, together with a discharge from the tank, is sufficient to form an ordinary siphon in the drop leg of the lower trap, which would pull all the water out of the lower trap. Then there would be no seal in the lower trap for the next flush, and the tank could not rarify the air in the entire soil pipe system. Consequently there would be no siphonage. The vent to the lower trap is to break the siphonage, which would otherwise be complete, and throw enough water back into the trap to seal it. The tank is arranged to break the siphonage of the upper trap in time to still furnish enough water to properly seal the upper trap.

When one trap is under the floor the floor joint must be trustworthy. If air is permitted to leak into the space between the traps while the tank is operating it is apt to so nearly maintain a plenum that no siphonage can take place. Care must be taken to see that the under floor work is safe when setting a closet of this kind in an old job. A waste pipe carried into the trap under the floor above the seal will prevent siphonage. For the same reason no waste should be connected to the lower trap of a pneumatic closet in new work. It was once the custom to branch bath and lavatory waste pipes into closet traps, always above the water level, however, if the other fixtures had traps also, in order to keep them from becoming air bound. A case of this kind may be overcome without disturbing the pipes when putting a pneumatic into an old job, by using a 3-inch ferrule, spread at the upper end and flanged over the flange of the old trap. The space between the ferrule and the trap is sufficient for the waste branched into the trap. The ferrule must end well down into the water, and the plumber must make certain that the crown of the trap is vented.

The accompanying illustration does not conform to any principles of the strictly pneumatic closet perfectly. A side section of the earthenware is made to show the pipe connections more distinctly. The trap under the floor is a 4-inch lead "S" with 2-inch crown vent. The

earthenware contains one trap. The floor joint is made by flanging the lead trap into and soldering it to a brass floor flange. The floor flange is screwed to the floor, and the earthenware is fastened to it by bolts which are slipped into slots in the flange, pass up through the earthenware flange and hold it by blind nuts screwed on the upper end. Ordinary glazier's putty is used between the two flanges. When a closet with two traps in the earthenware is used it is not necessary to take so much care with the floor joint.

Pneumatic closets of this type always have three pipes—the supply to the ball cock in the tank, the air pipe connecting the air space between the traps with the siphon breaker, and flush pipe or service box of the tank, the flush pipe, which carries the water from the tank to the closet. The tank shown is known as a single-charge tank. These closets are also furnished with a double charge tank which offsets the disadvantage of intermittent supplies to some extent. The double charge-

Pneumatic Water Closets.

tank has a false bottom which makes a service box of the lower part to which the water is admitted through a valve of large area, operated by the regular pull. The water falls into the service box much faster than the flush can carry it out; hence the pull need not be held much longer than it takes to start a siphon.

These tanks provide bowl ventilation by connecting the siphon breaker well with a hot flue and are otherwise ideal in action, but the forming of the service box necessitates exposing solder to the action of the water, which in many localities causes it to leak in a short time. When the seams leak they are very difficult to solder, and are generally dreaded by plumbers and not recommended by those who have had experience with them. The single charge tank has no objectionable feature of this kind. Lifting the flush valve permits the water to fall into the flush pipe. The valve seat casting has a cavity from which is an air passage, A, to the air pipe connection. The water falling into the flush pipe sucks aid through the passage A. The siphon breaker cap being closed at the top and sealed by water in the tank at the bottom, the air in the space between the traps is sucked out, up through the air pipe, through the-

passage A and down the flush pipe with the water. As soon as the air in the space B is sufficiently rarified the atmospheric pressure in the room presses the water out of the bowl. The water in the lower trap having risen somewhat, because of the reduced pressure, the seal of both traps fall with enough momentum to cleanse the lower trap and produce a siphon in its drop leg which is broken by the crown vent in time to save a seal for the lower trap. Siphonage continues from the bowl until the water level in the tank gets below the end of the siphon breaker. Air then begins to come to the passage A from the tank. The balance of the water in the tank acts as an after fill until the flush is broken. Air from the tank fills the void space in B. Water refills the tank and seals the lower end of the siphon breaker. Then the closet is ready for another flush. A $\frac{5}{8}$ -inch pipe will sometimes do well for the air pipe, but $\frac{3}{4}$ -inch is recommended. Soil and bits of paper are often drawn up into the air pipe, and sometimes clog it so the closet will not work. A piece of paper sometimes gets over the air pipe connection in the closet traps and causes it to fail to siphon.

Exhausting the air from between the traps down the flush pipe has been objected to by some, but as the air is drawn from above, a trap which has been cleansed by siphonage, the objection has little weight.

Death of C. J. McCubbin.

The supply trade will learn with regret of the death of C. J. McCubbin, at his home in Washington, D. C., on July 16, in the forty-fifth year of his age. Mr. McCubbin was seated at the breakfast table and had expressed himself as feeling as well as he ever did in his life, when he was suddenly seized with illness. He was quickly assisted to a couch, but died in a few minutes. His death was due to troubles of an apoplectic nature. Mr. McCubbin was identified for many years with the James Robertson Mfg. Company of Baltimore, Md., and left this house to assume the position of manager of the Washington branch of the Henry McShane Mfg. Company. He continued in this position until August, 1896, when, as head of the C. J. McCubbin Company, he bought out the interest of the Henry McShane Mfg. Company in Washington. He held the position of president of the company at the time of his death. Mr. McCubbin was widely known through his business relations and connections in the trade, and all who knew him will severely feel his loss.

The Colwell Lead Company.

The wayfarer on Centre street, New York City, will not fail to be impressed with the changed appearance of the exterior of No. 63, the home for many years of the Colwell Lead Company. It has assumed a brilliant cerulean hue within the past few days, in sharp contrast with its dull colored surroundings. Dark red trimmings lighten the effect of the blue front, and a large new blue sign, bearing in white letters the name of the concern, has been placed on the top of the building. The tall shot tower at the rear, which has stood for many long years as a landmark in the district, has also been treated to a coat of blue paint. The whole effect is decidedly striking.

The handsome showrooms of the Colwell Lead Company, which occupy the ground floor of the building at the corner of Centre and Pearl streets, are among the most attractive of their kind in the city. The display of high grade sanitary ware, including bathtubs, wash basins, closets, showers, laundry tubs, sinks and bath and toilet room furnishings of all kinds, is arranged with great taste amid harmonious surroundings. Large plate glass windows permit a fine view of the goods to be had from the exterior of the store. The business offices of the company have been removed from their former location, at 63 Centre street, to more commodious quarters at Centre and Pearl streets, where they occupy the entire floor above the showrooms.

CITIZENS of Millersburg, Ohio, are negotiating for the erection in that city of a hot water heating and electric lighting plant.

BROOKLYN MASTER PLUMBERS' OUTING.

One of the most enjoyable events in the plumbing trade is the annual outing of the Brooklyn Branch of the Association of Master Plumbers of New York. Donnelly's Grove at College Point on the Sound has been proved in the past to afford the greatest attractions, and this year again the Brooklyn plumbers, with their wives, sweethearts and children and a contingent of supply men, embarked on Wednesday morning at the Bridge Dock to the music of Lent's band. The weather was exceptionally fine, and after a pleasant trip up the Sound all were ready for the fish breakfast served by Mine Host Donnelly.

The programme of sports arranged by the Athletic Committee, E. S. Kelly and William Brown, was then begun. The plumbers' ball team were behind until the end of the third inning, when, their score being 9 to 6 for the supply men's team, they stopped the game, because, as they said, their opponents had no use for the prize of Stillson wrenches presented by the Ronalds & Johnson Company for each man on the winning team. The bowling match between a New York and a Brooklyn team was won by the Brooklynites to the tune of 568 to 518, amid much merriment and plenty of encouragement and advice. The tug of war was made by 341 plumbers, with the assistance of Bart Donohoe, against seven supply men, and the nickel plated traps given by the F. N. Du Bois Company are to be broken up as souvenirs of the event.

Boxes of "Huyler's" at the end of the course was the incentive for the ladies to race. The sack race for a 10-inch Stillson wrench, given by Thomas G. Knight, and a year's subscription given by *The Metal Worker*, caused much merriment. A lively hustle was produced in the walking match by hanging up an 18-inch Trimo wrench, presented by Spencer & Haviland, and a year's subscription by the *Plumbers' Trade Journal*. A fine sprint was made in the 100-yard dash to get the nickel plated trap presented by the F. N. Du Bois Company and the plumbers' tool bag given by Thomas Delaney, and the three-legged race became a scorch to get the gasoline torch given by the George P. Jacobs Company.

A potato race for a box of solder from the National Lead Company, a swimming match for model laundry tubs given by the Minns Sink & Specialty Company, a fat man's race for a bathtub, a boys' race for a 6-inch Stillson wrench, given by the McElreavy & Hauck Company, and shot putting and hammer throwing contests completed the athletic programme. The dancing pavilion was a scene of gay activity, and when the march for dinner was called a goodly assembly reached the dining-room voting the Committee of Arrangements to be jolly good fellows. They were E. Macdonald, William M. Brown, Wm. Eiermann, S. J. Corcoran, Lewis Deiser and George W. Smyth. Among the Brooklyn members who assisted in dispensing hospitality were war veteran Thomas Kelly, ex-President M. F. Gleason, C. Bosch and J. Sheppard.

Among the guests were I. J. Brown, A. H. Brown, T. A. Hill, Philip Brady, John Renahan, B. Donohoe, and Executive Clerk Lockwood, of the Manhattan Branch; Frank K. Chew of *The Metal Worker*, A. A. Ainsworth of the *Plumbers' Trade Journal* and J. Bailey of *Domestic Engineering*. The representatives of the supply trade come from the Ivory Mfg. Company, Thatcher Furnace Company, Syracuse Stove Works, Ronalds & Johnson Company, Thomas G. Knight, Jenkins Bros., Cornell & Underhill, National Lead Company, Minn's Sink & Specialty Company, Spencer & Haviland, McElreavy & Hauck Company, Alberene Stone Company, George P. Jacobs Company, McCall & Sheer, Central Foundry Company, American Radiator Company, J. L. Mott Iron Works, Crane Company, H. P. Reed Lead Works. Estate of A. Froelich, John M. Wolff Company, McConnell Slate Company, Rossmore Company, W. C. Vosburg Mfg. Company, Thompson Meter Company, E. P. Gleason Mfg. Company, Colwell Lead Company, Hart-Ayres Plumbing Company, Robinson Stoneware Company, Richardson & Boynton Company, E. S. Wheeler Company, Coyne & Delaney, Weehawken Granite Company.

Thomas M. Delaney, German Groeb & Son, McMann & Taylor, Chas. Graham, Chemical Pottery Works, John Clark, F. A. Hannweber, James Luckett, Lynch & Cullen, W. H. Ramsdell, W. T. Baker, Incorporated, James Devlin, John Cooper, Patrick McNamee, Malbin & Kammerman, Herman Wood Mfg. Company, Sternau & Co., F. N. Du Bois Company, Behrer & Co., and the United States Radiator Company.

After dinner the party started for the boat, and the home journey was enlivened by the presentation of the prizes. At parting the day was voted to have been one of the most pleasant that the members of the association have ever enjoyed together.

Three-Column Penn Radiator.

The Penn Radiator Company, Corry, Pa., have made substantial improvements in the line of radiators which they offer to the heating trade. In the accompanying illustration we show the three-column Penn radiator, which is made for both steam and hot water heating.

The Three-Column Penn Radiator.

This radiator has sections $9\frac{1}{4}$ inches wide, with legs $9\frac{1}{2}$ inches in width. The sections are $2\frac{1}{2}$ inches in thickness and are made to have 5 square feet of surface per loop of 38 inches high. The radiator is made in heights of 20, 26, 32, 38 and 45 inches. All the openings are tapped with right hand thread, having an opening $4\frac{1}{2}$ inches from the floor to the center. The company state they have been careful in preparing their line of radiators for the market so as to remove all obstructions that would impede circulation, and have so constructed them that the joints would be absolutely tight. The style can be seen from the illustration, and the finish by an examination of their goods, which are found in the sample rooms of the jobbers in many of the large cities.

New York City Notes.

The vacation school work has been given out at last. Among the lucky bidders are Frank J. Fee, James Fay, Mills Brothers, O'Brien & Ryder, M. M. Golding, William Horn, John Wood, John Spence and D. J. Deady.

* * *

The inspectors of the Tenement House Department are beginning to be noticed on the streets as part of the uniformed forces of the city. They are especially noticeable on account of the leather bag which they carry and which contains their blanks, rules and measures, &c. The round, rising sun badge they wear is also noticeable. Should they keep on as they are going they will make lots of overhauling work soon.

The Building Department is taking active measures against unlicensed plumbers who are carrying on business and exposing signs to that effect. A long list of such offenders has just been made up by the Law Committee of the Master Plumbers' Association and handed to the department for prosecution.

* * *

Although trade, as a whole, is slack, some of the new work plumbers keep busy, among whom are Jacob Manneschmitt of Brooklyn, with a job at 164-166 Park row; Beck Bros. of 598 Ninth avenue, with four tenements at 317 to 325 West Forty-second street, and Sam Friedman, with a factory building on Eightieth street east of Avenue A. J. H. Hindley has a job which will almost count as a new one on Fifty-second street near Madison avenue. F. S. Schumann has a large factory building on 116th street near Pleasant avenue. Gus Staats is busy in overhauling a hotel at Fifty-ninth street and Lexington avenue, and is doing a new apartment house on Fifty-ninth street between Lexington and Third avenues. Michael J. O'Keefe will soon be busy with work in an apartment hotel that is being put up at Madison avenue and Sixtieth street for the Fifth avenue Realty Company. Jas. Armstrong has a 12-story office building at 113-115 Cedar street, and W. H. Quick has a piano salesroom and office building at 210 Fifth avenue.

* * *

The plumbers doing city work will have to adjust their wage schedule to comply with the prevailing rate of \$7 a day for man and helper, as adopted by the association not long ago.

NEW JERSEY STATE ASSOCIATION OF MASTER PLUMBERS.

Master plumbers of New Jersey from Atlantic City, Asbury Park, Newark, Passaic, Hoboken, Jersey City, Bayonne, and other cities, met in Newark, N. J., on July 15 for the purpose of organizing a State Association of Master Plumbers. After preliminary discussion an organization was effected and the following officers elected:

President, Ira Budd, Newark.

Vice-President, Frank Walsh, Atlantic City.

Secretary, E. A. Bleything, Newark.

Financial Secretary, J. Lang, Jersey City.

Treasurer, W. H. Aldous, Passaic.

Sergeant-at-Arms, Robert Zeitler, Newark.

The President appointed the following Committee on Constitution and By-Laws: W. Zimmerman, A. S. Walker and W. H. Aldous. The meeting adjourned subject to the call of the president.

Newark, N. J., Master Plumbers' Outing.

After having one experience up the Sound, the Master Plumbers of Newark, N. J., returned to their tried and satisfactory recreation ground at Port au Peck, N. J., for their annual outing on Wednesday of this week. Mine Host Wardwell is said to have outdone himself in the shore dinner this year and the epicures of the trade are not yet done singing praises over the clams and what followed. There were 160 plumbers and supply men to pass judgment, including the whole North Hudson County Association. They also had as guests President Gregor Drummond and Secretary Howard A. Smith of the Pennsylvania State Association, and Louis J. Somers, National State Vice-President for Pennsylvania. President Drummond had his first experience with clams, and has already accepted an invitation for next year. F. B. Raymond of the Thatcher Furnace Company was the dean of the supply men and vouches for the perfection of the feast. A baseball match and other sports entertained the plumbers, who also embraced the opportunity to do good association work. Voss' Band enlivened the occasion and the Committee of Arrangements can be reappointed if they desire that honor, for everybody congratulated them on the excellence of their provisions. The committee was composed of the following: A. S. Walker, chairman; William Jacobi, F. J. Sturn, E. A. Bleything, E. M. Sterling and President Ira Budd.

Connections with Vitrified Pipe Sewers.

The tendency in the plumbing trade for some time has been to substitute extra heavy cast iron pipe for earthen sewer pipe, no matter what grade. For this reason interest will be taken in the subjoined article from *Municipal Engineering*. The statement having been made that it is absolutely not permissible to cut a hole into a vitrified sewer pipe and insert a house connection, some claimed that it had been frequently permitted, the incision being cut on a bevel and the inlet cut to fit, the whole then being neatly and smoothly cemented both inside and out. In addition the questions were asked whether the authorities were unanimous in their agreement in reference to the first statement, and whether the exchange of straight pipe for a Y was as apt to cause trouble as a neatly inserted beveled pipe. The reply made to the questions is as follows:

The authorities seem to be unanimously of the opinion as given above. It is perhaps possible to make the connection in the manner suggested, but it is not probable that it will be well made. The beveled pipe can be made, for as many pipes may be spoiled as may be necessary to get one of the proper form to fit the outside of the sewer pipe. It is, however, a much more difficult matter to cut the hole in the sewer pipe so that it will be exactly right, and the pipe is very likely to be cracked in the process or its joints started. The chips are quite likely to fall into the sewer, where they may give trouble later. It is quite impossible to know how much of an obstruction is made by cement and other materials in the sewer in making the joint until trouble develops later from stoppage. If the joint is properly made it will be necessary to tamp the earth under the beveled pipe after it is laid, and unless this process is delayed until the cement has fully set, the joint is certain to be injured and left in a leaky condition. Even if permitted to harden before the tamping and filling are done, the joint may be broken by subsequent pressure from above and settlement, unless a large amount of mortar is used in which to imbed the two pipes forming the joint.

If the hole in the sewer pipe is properly cut without injuring the pipe, which is unlikely, the rest of the work of setting the pipe outside can be done by skillful men with plenty of materials, but close inspection is absolutely necessary, otherwise any injury to pipe or joint will be covered up and the joint will be imperfect. It is certainly not permissible to cut the hole large enough to insert the beveled pipe in it. There is too much danger of the pipe being forced into the sewer in setting, or later by settlement of the trench, as well as of breaking the sewer pipe by the connecting pipe acting as a lever when settlement occurs.

If, as is probable, the sewer pipe is injured in cutting the hole, it must be removed and the Y inserted. There are so few cases in which the hole can be cut properly and safely, and the amount of material and time used for proper construction is so great, that it is no hardship to require the insertion of the Y without waiting to try to cut the hole.

The necessary part of the bell can be cut from the new pipe and from the sewer pipe, and much of the length to be removed can be taken out before the sewage is shut off. A dam can be put in at the nearest manhole and another in the pipe just above the opening, if necessary, so that possibly no house connections need be shut off. Prompt work in taking out the pipe, laying the mortar bed for the new pipe and packing and cementing the joint will reduce the time consumed to a minimum.

THE LOS ANGELES HEATING COMPANY of Los Angeles, Cal., have recently been awarded some important heating contracts in that city and vicinity. They are now installing an elaborate heating plant in the palatial residence recently completed for Shippa Pietra on his estate near Los Angeles. One of the largest Superior Steel Furnaces, manufactured by the Utica Heater Company of Utica, N. Y., will be used. The Los Angeles Heating Company are general distributing agents in Southern California for the company named. Solid Bronze Registers and the most expensive fittings will be used throughout, and when completed, it will, it is said, be one of the finest warm air heating systems on the Southern Pacific Coast.

J. B. WEIANT, New Britain, Conn., is plumbing six houses for C. A. Parker and a house for Edward Parker. He also has the plumbing of a new house which Carlson & Torell are building in New Britain.

Heating and Plumbing Notes.

A. E. VESPER of Pasadena, Cal., has a plumbing contract amounting to \$75,000 for a new hotel at Santa Barbara.

LIBBY & BLINN, Hartford, Conn., have the contract for installing a 10-section No. 3 Mercer Hot Water Boiler in a block on Main street for Henry Kohn & Sons and a 12-section No. 2 Mercer Boiler for Francis Parsons on Main street, and the heating of an additional ward in the Hartford Hospital. Among other contracts is one for work in the gymnasium at Trinity College, and two 80 horse-power wrought iron Tubular Boilers for the West Middle School, to take the place of five other Boilers.

THE ACETYLENE GAS COMPANY OF AUSTRALIA, LIMITED, are reported to be doing a large and growing business in the Antipodes. A rapidly increasing demand is noted for the Reservoirs, Pipes, Burners and other metallic appliances connected with the production of acetylene gas.

CHRIS. WATZ of Denison, Texas, has celebrated the eighteenth anniversary of his business establishment in that city. In addition to carrying a large stock of Bath-tubs, Water Closets and Plumbers' Goods at his store, at 303 West Woodward street, he also carries Iron Pipe, Steam Fittings, Water Filters and Tools. He has a well equipped shop for steam and hot water heating work and also a sheet metal working shop, where, in addition to doing roofing and guttering, he manufactures Skylights, Cornices and Galvanized Iron Cisterns, and has made a specialty of putting up Metal Ceilings. A notable piece of his work in Metal Ceiling, Tin work and Cornices is shown on the new Methodist Church in Denison.

WILLIAMS BROTHERS, Detroit, Mich., are the architects for the addition to the Amherstburg Public School, which will include a heating, ventilating and plumbing system. The improvements are to cost \$10,000.

THE Mississippi State House Commission at Jackson, Miss., will award contracts aggregating over \$100,000 at the meeting in September, when bids will be opened for the electric lighting, steam heating plant, gas fixtures and similar work.

HUFFMAN & CONKLIN, Columbus, Ohio, bid \$14,000 and secured the contract for steam heating the building to be erected under the management of the trustees of the Institution for the Blind in that city. They were also awarded the plumbing contract for the same building at their bid of \$2850.

DAVID CRAIG of Boston, the new member of the Executive Committee of the National Association of Master Plumbers, is reported to have made a very able address at the annual outing of the New Hampshire State Association of Master Plumbers, at Hampton Beach, last week.

THE Kansas City branch of the Crane Company of Chicago report that their sales this year show a substantial increase over the sales of preceding years since the house has been established in that city.

At a joint meeting of the Health and Ordinance Committees of the City Council of New Britain, Conn., a request to make an amendment to the plumbing ordinance, so as to allow the use of couplings in making connections as well as wiped joints, was referred to a special committee on plumbing, composed of Timothy E. Burns and Charles E. Morey.

THE capital stock of the Reason Automatic Air Pump Company, Pontiac, Mich., has been increased from \$12,000 to \$25,000.

H. HALL MARSHALL, consulting engineer, of Philadelphia, is preparing plans for the heating, lighting and power plant of a five-story kitchen and laundry addition, 56 x 105 feet, to a hotel building in Reading, Pa.

C. H. BROWN, Mystic, Conn., is making extensive repairs and improvements in the plumbing and toilet rooms of the A. O. U. W. Lodge rooms in that city.

THE trustees of the New Hampshire School for Feeble Minded Children will receive, until August 1, at the office of William J. Ahern, Secretary of the State Board

of Charities and Correction, Concord, N. H., bids for plumbing, heating and ventilating the new dormitory building to be erected at Laconia, N. H.

J. B. ELKIN, engineer for the Secretary of State, Columbia, S. C., informs us that the State is about to receive bids for a new steam heating apparatus for the State House.

BALLAMY & HORNUNG, Omaha, Neb., have secured a contract amounting to \$19,950 for plumbing and heating the new addition to the Federal Building in that city.

FRANCIS J. TORRANCE, vice-president of the Standard Sanitary Mfg. Company, at Pittsburgh, Pa., has been elected a director in the Second National Bank in that city.

THE WHEELING STEEL & IRON COMPANY, Wheeling, W. Va., are installing three new gas producers for supplying the heating furnaces at the Tube mill at Benwood. Work on the new Tube mill of this concern is not progressing as fast as desired, owing to delay in securing material.

THE AMERICAN TANK & FIXTURE COMPANY, Chicago, have changed their name to the Acorn Brass Mfg. Company and increased their capital from \$50,000 to \$200,000.

THE QUEEN CITY BRASS & IRON WORKS COMPANY, Cincinnati, Ohio, report quite an extensive and growing demand for their Valves, their present business being the largest in the history of the concern. From the amount of orders they are receiving from engine builders all over the land it would appear that that branch of trade is more than usually brilliant. Their trade in Steam Fitters' and Plumbers' Supplies is also good for this time and the outlook is considered first class.

THE directors of the Boeseke-Dawe Company, successors to Edwards & Co., dealers in General Hardware, Plumbing Goods, &c., Santa Barbara, Cal., have elected M. C. Faulding to succeed T. R. Dawe in the management of the establishment. Mr. Faulding has been identified with the business for the past 16 years and is thoroughly familiar with all its details.

M. J. HALLAHAN of the plumbing firm of Hallahan & Costello, Augusta, Ga., has been in New York City with J. Lindsay for the purpose of studying the plumbing in the best hotels in New York City and the North, for the purpose of determining on the best modern system of plumbing for the new Augusta Hotel, at Hampton Terrace, Ga.

MICHAEL F. DOLAN, who carried on a plumbing business at Oneonta, N. Y., died at his residence on July 9 from Bright's disease, aged 47 years. He is survived by his wife, two sons and a daughter.

THE BURLEY HEATER COMPANY, Tyrone, Pa., are issuing a 16-page catalogue printed in two colors and bound in a dark brown cover, on which there is an embossed design and the words "Burley Heaters" in silver gilt. The Burley Heater is adapted for steam or hot water heating, and is of the vertical, sectional type, made with grates 14, 20 and 36 inches wide, and rated to carry from 275 to 3500 square feet of direct steam radiation.

ROBERTS & GARDNER bid \$524 and secured the contract for placing a new steam heating boiler in a school house at Wellsboro, Pa.

Bids will be received until August 6 for installing a new system of plumbing in the Government Building at Erie, Pa.

C. F. WILLS, the new plumbing inspector of Pueblo, Col., is making an exhaustive examination of the plumbing system of the public buildings in that city and improvements are to be made in them.

L. LUDERBACH, J. M. Keeley, John Finan, J. A. Aitkin, F. H. Penula and J. D. Burghardt are a committee from the Master Plumbers Association of New Orleans, La., appointed to draft plumbing rules and regulations for that city in accordance with the new sanitary plumbing law recently passed by the State Legislature.

THE C. F. CHURCH MFG. COMPANY, Holyoke, Mass., are issuing an eight-page catalogue devoted to their Flexine Sanitoure White Enameled Bath and Specialties. This Enamel is said to be of high finish and dur-

able, so that it will neither crack nor flake, but hold its polish indefinitely, while being a nonconductor, it is agreeable in either hot or cold weather. Another feature is that it is impervious to moisture and will not stain. This finish can be applied to wood or metal surfaces in any color. The catalogue contains half-tone engravings, showing Swell Front Low Down Flushing Tanks, Overhead Flushing Tanks, Bath Seats, Water Closet Seats and Covers, Medicine Cabinets, Mirror Frames and Bathroom Stools. The character of the goods and their finish will make the catalogue of interest to the plumbing trade.

GEORGE W. ROW, Omaha, Neb., has secured the contract for plumbing and heating the new First Baptist Church at Utica, Neb.

THE July edition of the "Directory of Recognized Master Plumbers" in localities where there are members of the National Association of Master Plumbers, which has just been issued from the headquarters of President Hornbrook, at Kansas City, Mo., shows the association to be in a flourishing condition, with additional members since the sixth edition was distributed.

THE metal polishers, buffers, platers, brass molders and brass finishers of Cleveland, Ohio, have won their fight for a nine-hour working day. Eighteen manufacturing concerns, among which are some of the largest Plumbing Goods houses in the country, have conceded the demand of their men in this respect.

New Firms and Changes.

THE WESTERN MANTLE COMPANY have been incorporated at Portland, Ore., with a capital of \$5000, to manufacture and sell Gas and Gasoline Mantles. The incorporators are F. H. Reynal, P. H. Lacy and Louis Reno.

S. H. SAYRE AND C. R. SAYRE have organized the firm of Sayre Brothers, at Hampton, Va., and will engage in general foundry, steam and hot water and warm air heating work. They will also manufacture Steam and Hot Water Boilers, Furnaces, and Structural Cast Iron Work.

THE LYNCHBURG SUPPLY & FOUNDRY COMPANY of Lynchburg, Va., succeed the Lynchburg Supply Company, and propose to construct a foundry for the purpose of manufacturing Pipe.

THE NATURAL VENTILATING COMPANY of New York City have been incorporated with a capital of \$250,000. The following are the directors: Charles E. Pennwyer, Julius M. Ferguson and John Willett.

THE GLEASON, BAILEY & SCIPLE MFG. COMPANY of Seneca Falls, N. Y., have been incorporated with a capital of \$200,000 to manufacture Pumps and Hydraulic Appliances, with the following directors: R. J. Purcell, Atlantic City, N. J., and Frank C. Beebee and T. R. Sciple, Seneca Falls, N. Y.

Commercially Pure Aluminum.

The color of commercially pure aluminum depends, says the *Aluminum World*, upon the temperature at which the metal has been treated. Cast in chill molds and cooled quickly, or cast in green sand at a low temperature, the metal has a bright white color, nearly like that of silver. When cast too hot in dry sand, the color is gray, like lead, or bluish, like zinc. The fracture grain differs considerably according to the method of casting, cooling or working. When drawn, rolled, or forged, the metal shows a silky grain. The specific gravity of commercially pure aluminum varies at atmospheric temperature from 2.56, when cast in sand, to 2.71, when hammered or drawn.

Under the title "Top or Bottom—Which?" Archer Brown of Rogers, Brown & Co., New York, has issued for private circulation a neatly printed pamphlet addressed to boys. It is a "study of the factors which most contribute to the success of young men," and is dedicated to his sons, Archer and Lowell. There are interesting introductions contributed by Bishop Charles H. Fowler, Hamilton W. Mabie, Irving Bacheller, Andrew Carnegie and James B. Angell, president of Michigan University.

Stove and Hardware Dealers.

ALLEN BROWN & Co. have lately commenced the Shelf Hardware and Tinware business in Stafford Springs, Conn.

W. W. CORKINS has purchased the retail Hardware, Stove, Tinware, Farm Implement and Sporting Goods business at Fulton, S. D., formerly conducted by Holmes & Howe.

W. T. PETERS, Algonquin, Ill., has disposed of his Hardware, Stove and Tinware business to S. D. Baxter, who continues at the old stand.

THE Hardware and Stove firm of T. J. Carman & Co., Mayfield, Ky., have dissolved. T. J. Carman is successor.

LYNWILER & SON, dealers in Hardware, Stoves, Tinware, Agricultural Implements, Sporting Goods, &c., are closing out their business in Greencastle, Mo.

PHILLIPS & CALLIN, dealers in Hardware, Stoves and Agricultural Implements, Bloomfield, Iowa, have been succeeded by Hardy & Son.

SKALAK & ATWOOD have succeeded Skalak & Son in the Hardware, Stove, Agricultural Implement and Windmill business in Humboldt, Neb.

F. J. EVANS & Co., dealers in Hardware, Stoves and Tinware, Corsicana, Texas, have been succeeded by J. E. Deckard, who will continue at the old stand. Mr. Evans will embark in the furniture business in the fall, handling also Stoves, Tinware and Household Goods.

RENICK HARDWARE COMPANY have lately opened up in the Hardware, Tinware, Paint and Oil and furniture business at Falling Spring, W. Va.

ABRAM H. TOWER, in the Hardware, Stove, Agricultural Implement and plumbing business in Stoughton, Mass., has been succeeded by W. P. Hutchinson.

SLABA & WAGNER, Hardware, Stove and Harness merchants, Buffalo Center, Iowa, have been succeeded by H. A. Wagner.

NORWOOD & STRINGFELLOW have succeeded B. F. Cooper in the Hardware, Stove, Agricultural Implement and Sporting Goods business in Oakdale, Neb.

J. C. DE LAPORTE has succeeded De Laporte & Lofton in the Hardware, Stove and Farm Implement business in Ladonia, Mo. Mr. De Laporte has adopted the cash system of doing business. He is also remodeling his store.

THE Executive Committee of the Chicago Retail Hardware Dealers' Association have decided to postpone the eighth annual picnic until Wednesday, July 30, two weeks from the original date, as the additional time will allow for more thorough preparation. An effort is being made to have a number of manufacturers and dealers from both the East and the West attend the outing, and success seems likely to attend the efforts of the committee. A circular letter is being mailed to all Hardware dealers throughout Chicago territory, notifying them that the tickets previously issued for transportation and the prizes will be honored on July 30 as though the picnic had not been postponed.

O. R. RICH & SON have succeeded L. A. Young & Co. in the retail Hardware, Stove, Agricultural Implement and Sporting Goods business in Judsonia, Ark.

HORTON & ELLIOTT, Ulster, Pa., have purchased the Hardware, Stove and Sporting Goods stock of H. D. Bolt. They are occupying a new building 24 x 48 feet in dimensions.

SMALLEY & CASE have succeeded D. H. Smalley in the Hardware, Stove and Sporting Goods business in Moran, O. T.

DEYOE BROS., who several months since purchased the business of Phinney Stove & Hardware Company, 1530 Market street, San Francisco, Cal., have altered and materially improved the establishment, and have also increased the stock formerly carried. Besides carrying Hardware and Stoves the firm also conduct a tin and plumbing shop.

THE wholesale and retail Hardware, Stove and Farm Implement business at Cynthiana, Ky., formerly conducted under the style of G. H. Watts & Co., is now being carried on under the name of Fred. G. Jenkins.

Mr. Jenkins is building a 40 x 20 feet addition to the rear of the establishment, and putting in new floor cases and other modern fixtures.

W. S. TUFTS has succeeded John Christenson in the Hardware, Stove, Agricultural Implement, Sporting Goods and furniture business in Withee, Wis.

FRANK M. DAVIS is successor to Davis & Co. in the Hardware, Stove, Farm Implement and Sporting Goods business in Blairstown, Iowa.

FOSTER & WILSON, Harbor Springs, Mich., are successors to Foster, Burke & Wilson in the Hardware, Stove, Tinware and grocery business.

R. C. JOSEY & Co., dealers in Hardware, Stoves, Farming Implements, Mill Supplies, &c., Scotland Neck, N. C., have been succeeded by Josey Hardware Company.

J. SCRANTON is successor to Lohr Bros., Cashion, O. T., and will continue the retail Shelf Hardware, Stove, Tinware and Sporting Goods business.

THE LESLIE HARDWARE COMPANY, Sharon, Pa., with capital stock of \$25,000, have succeeded the old firm of W. O. Leslie & Son, established in 1870. The officers of the new concern are John S. Leslie, president; P. J. Koch, vice-president, and N. L. Williams, secretary and treasurer. The company have moved into new quarters, consisting of two main rooms, 20 x 100 feet each, with 60-foot wareroom and plumbing shop in the rear. They do a wholesale and retail business in Shelf and Heavy Hardware, Stoves and Tinware, Agricultural Implements, &c., having also a plumbing and steam and hot water heating department.

BAGLEY BROS. have sold their Hardware, Stove and Sporting Goods business in Creighton, Neb., to W. B. Warrington & Son.

DENISON-CARDER HARDWARE COMPANY are successors to H. C. Denison & Son in the Hardware, Stove, Farming Implement and Sporting Goods business in Rocky, O. T. The new company report business on the increase and expect soon to erect a new building or make an addition to the present quarters.

TAGGART & THURBER, in the Hardware, Stove and Sporting Goods business in Warrensburg, Mo., have been succeeded by Thurber & Christopher.

SEVERAL months since the firm style of James A. O'Neil & Son, Henderson, N. C., was changed to Maurice J. O'Neil, who has been for more than two years past the owner and manager of the business. Mr. O'Neil contemplates soon making extensive improvements in the store interior, so as to materially increase the attractiveness and convenience of his establishment. Mr. O'Neil's line embraces Shelf and Heavy Hardware, Stoves, Tinware, Agricultural Implements, Sporting Goods, &c., which are handled at wholesale and retail.

Test of Oil Sprinkling for Streets in Denver.

A satisfactory test of oil sprinkling, says *Municipal Engineering*, was completed by the Board of Public Works at Denver, Col., June 14. The test was made in Logan avenue, and the surface of the street is said to be smooth and dustless. Crude oil from Beaumont, Texas, was mixed with the residuum oil from the refineries at Florence. It was heated in the sprinkling cart by means of steam pipes connected with one of the city's steam rollers, and applied with a spray nozzle. A coating of coarse sand 1 inch thick was then applied, and in 20 minutes the street had assumed its former appearance, except for a dark grayish hue, and it was impossible to raise the dust. Another application of oil will be given in a few months, and it will also be applied to other streets. It is estimated that the streets can thus be sprinkled and cemented at a cost of 20 cents a front foot per annum, or about \$25 a lot, which will make the cost for the entire city less than the amount now expended for water sprinkling.

The United States *Chargé d'Affaires* at Athens, Greece, reports that an international exposition of industry, commerce, arts and hygiene will be opened at Athens, October 15. American manufacturers are invited to send their products to this exhibition.

Putting Up Galvanized Iron Cornices.

BY WILLIAM NEUBECKER.

PART II.—FIRE PROOF CONSTRUCTION.

In the large cities the use of galvanized iron for cornice work is prohibited unless erected upon iron supports. It may be well to call attention here to some general features of this kind of work. In the first place the entire cornice up to 6 feet in high is made complete on the ground, or in the shop. If the job is in the same town where the shop is located the cornice

Putting Up Galvanized Iron Cornices.—Fig. 4.—Setting the Cornice in a Fire Proof Manner with Wrought Iron Lookouts.

is finished complete in the shop, while if the job is outside and the cornice must be shipped the work is put together in parts in the shop, shipped and assembled in one piece on the ground, as described below.

In Fig. 4 is shown the method of constructing a cornice on wrought iron brackets or lookouts. The foot molding A is first placed upon the bench, and the bracket N placed in position. It will be noticed that the foot mold has an edge bent upward, as shown at B. The bracket has an edge bent outward on each side, as shown in Fig. 5, in which N represents the bracket with edges or flanges bent outward, as shown by A and B. To these the panels R and S are riveted at A and B. The brackets being all placed in position in Fig. 4 the panels R and S are next placed, with an edge bent outward at the top and bottom, as shown. The lower edge rests upon the wash of the foot molding, taking out the buckles in the face of the panel, and is

Fig. 5.—Riveting the Panels.—Section through R S in Fig. 4.

riveted to the flange bent upward on the foot molding, as shown by B. The letters a, b and c indicate how the rivets are spaced, about 2 to 3 inches apart, 2-pound tinned rivets being generally used.

After the panels are in position the dentil course is hooked onto the edge which has been bent outward on the top of the panel, as shown at C, and riveted along d j, as shown. The brackets are now soldered to the dentil course, where they intersect at m, and the dentils u are soldered in their proper positions. It will be noticed that at the top of the dentil course on the cap mold a flange has been bent outward, as at D. To this

the crown molding and planceer, which have been formed in one piece, are riveted, as shown at D. A small edge has been bent toward the outside on the rear of the planceer, as shown by r s, which, when riveted, rests tightly against the cap mold, thus insur-

Fig. 6.—Riveting the Planceer.—Section through W X in Fig. 4.

ing a stiff joint, and at the same time taking out the waves and buckles in the flat surface of the planceer e. The crown mold E has a lock bent onto the top at F, to which the roofing is joined.

The method of fastening the cap of the bracket to the planceer X is shown in Fig. 6, in which N indicates the bracket, X the planceer and A and B the flanges bent outward on the cap of the bracket and riveted, as shown. In some cases, where the crown mold and planceer cannot be formed in one piece, it is customary to form the crown mold E, in Fig. 4, with the drip and flange as far as t, separate pieces being placed between the brackets, riveting to the flanges t and D and to the cap of the bracket, as shown by D in Fig. 6. By using pieces between the brackets in Fig. 4 the piece of metal covering the top of the bracket is saved. Where a cornice is constructed of copper it is well to plan the joints before laying out the cornice, as a vast amount of material can be saved in this manner. The same applies to the top of the modillions.

The cornice having been constructed on the ground, as above described, the next step is to insert the wrought iron lookouts or braces. These braces are made from $\frac{1}{4} \times 1\frac{1}{2}$ inch flat iron, bent to the required shape according to the detail drawing from which the cornice has been laid out. An anchor, I, is bent directly on the brace, a few inches less in length than the thickness of the wall, with holes punched where shown by the bolts. These holes should be 5-16 inch in diameter, so as to admit $\frac{1}{4}$ -inch bolts. Flat headed bolts should be employed, and the holes in the braces countersunk so as

Fig. 7.—Clamp on Iron Beam.

to leave a flat surface on the outside of the cornice. The braces should be placed not more than 4 feet apart, standing and blocking up the cornice temporarily on the foot molding until the braces are in position.

By means of a small stoneman's derrick the cornice is next hoisted in place, the usual lengths hoisted at one time being 24 to 28 feet, according to the weight of the cornice. Where the cornice is longer the vertical seams are put together when the cornice sets on the wall. The cornice being set on the leveled wall H, the rope from the derrick is slackened, but not removed until the cornice is thoroughly fastened, as follows: The drip G is drawn tightly against the wall by means of wire and fastened to the beam or wall. A wire is then fastened to the brace at & and drawn taut until the cornice sets perfectly plumb, when the anchors J and K are bolted in position, as shown at C and L. When the cornice sets true and plumb the wall is carried up, as shown, firmly securing the anchors I, J and K.

On top of the leveled wall K the wooden lookout L is placed to receive the roof for the top of the cornice, and between these lookouts the brick wall is carried to the underside of the roof boards. In case of fire the

only portion to burn would be the roof and lookout L, while the cornice would remain as long as the wall stood in place.

In some cases the lookout L is made of T and angle iron and filled with fire proof blocks, on top of which the roofing is laid. When the cornice is very high and of great projection on fire proof structures the lookouts are composed mainly of T and angles bolted or riveted directly to the iron beams of the structure. The wall is then carried as high as required at H, and the cornice set and fastened directly to these T and angle iron lookouts by means of bolts or heavy copper wire or $\frac{1}{8} \times \frac{3}{4}$ inch flat band iron. This, however, only occurs on large fire proof structures, the usual method being shown in Fig. 4.

When drawing in the foot molding and the beams are of iron, and the wire cannot be fastened well, a clamp is made, as shown in Fig. 7, which can be applied to the iron beam, and when the cornice is backed up with brick can be removed and used again. A dozen clamps are usually made, to be used when necessary. A represents the iron beam, onto which the clamp B, made of $\frac{1}{4} \times 1\frac{1}{2}$ inch flat iron is bolted by a $\frac{1}{2}$ -inch bolt passing through the hole C, which, when tightened, secures the clamp and holds it in position. Through the hole D the wires used in securing the cornice are fastened. It sometimes occurs that when the wires which have been fastened at &, in Fig. 4, are fastened to the beam to hold the cornice in a plumb position they have a tendency to loosen if the wire is very heavy or hard and cannot be drawn taut. This is overcome by placing an iron rod or other object between the wires, as shown at E in Fig. 7, when, by turning, the wires are drawn taut and the cornice is drawn in as much as necessary.

(To be continued.)

THE AMALGAMATED ASSOCIATION NEGOTIATIONS.

It is reported in Pittsburg that Theodore Shaffer, president of the Amalgamated Association of Iron, Steel and Tin Plate Workers, said that the majority of the lodges of tin plate workers had voted in favor of the proposition suggested at the recent conference between the officials of the American Tin Plate Company and the Amalgamated Association. This proposition provides that the men accept a 25 per cent. reduction in wages from the present scale on certain work. By thus lessening the cost of production it is expected to retain in this country the business of the Standard Oil Company, who consume about 1,500,000 boxes of tin plates, and which at present are imported from Wales. As these plates are for making cases used in shipping oil abroad they are almost duty free under the drawback clause of the tariff. As the present rate of consumption in this country is not equal to the productive capacity of the mills, the officers of the American Tin Plate Company and the Amalgamated Association are alike desirous of manufacturing at least a portion of the 1,500,000 boxes in this country so as to keep the men and mills busy at all times. The subject is now being considered by the separate lodges, but all have not voted on the matter as yet. The outcome will probably not be known until next Monday. The officials of the Amalgamated Association are heartily in favor of the plan.

THE name selected for the new company incorporated with a capital stock of \$250,000 to erect a Sheet and Tin Plate plant at Atlanta, Ind., is the Atlanta Rolling Mill & Tin Plate Company. The directors are: Harold B. Hibben of Indianapolis, Henry Roads of Atlanta, William H. Marker of Tipton, Ind.; Henderson Coppock of Elkin, L. C. McFatrige of Nobelsville, and J. M. Whistler of Atlanta.

A PRESS DISPATCH from Canonsburg, Pa., says that a company of local capitalists have closed a deal for the purchase of the Canonsburg plant of the American Tin Plate Company for \$125,000. The new company are headed by Senator John F. Budke, formerly superintendent of the mill, and will be capitalized at \$250,000.

THE MANUFACTURE OF TIN PLATE IN SOUTH WALES.*

BY W. H. TREGONING.

The oldest industry in this country is probably that connected with the production of tin. In the earliest ages the prehistoric Briton dealt with the outside world in tin. But the real tin plate industry is of much more recent date. The hub of this industry is in the coal field of South Wales. In Glamorgan, Carmathenshire and Monmouthshire there are about 450 tin plate mills, capable of turning out between 13,000,000 and 14,000,000 boxes—that is, nearly 700,000 tons—of tin plate yearly. The early tin plate mills were nearly all driven by water power, and this fact accounts for the establishment of many of the oldest mills beyond the limits of the coal fields.

Up to the year 1891 South Wales practically made the tin plates of the world, exporting enormous quantities to America and to other parts of the world. But by far the largest customer was the United States of America. In 1891 the American market was closed to the British by the introduction of the McKinley Tariff bill, which raised the duty on tin plates from 4 shillings 6 pence to 9 shillings 9 pence per box; and then the troubles of the trade began. A box of tin plates of the size and weight upon which this duty is levied is worth in the market about 13 shillings.

After four years of the McKinley tariff the Wilson tariff came into operation, the present duty in the United States of America on tin plates being 5 shillings 7 pence per box. In addition to this duty, freight from South Wales to Philadelphia or New York works out at about 8 pence per box, while to Chicago freight charges amount to about 1 shilling 4 pence per box. Consequently the American buyer has to pay in Chicago 19 shillings 11 pence for that which can be obtained in London for 13 shillings; so perhaps it is not surprising that he prefers to make his own tin plates.

In the last ten years tin plate manufacturers have had to look around for new markets, and have succeeded in getting together a fair trade with the Continent, Austria, Russia, Australia and South America. The business of the tin plate manufacturer is not to make saucepans, boxes, milk cans, &c., but to produce the tin plate from which these articles may be made by the stamper or tinsmith. In the early days when the plates were made of iron there was but little stamping or spinning in comparison with what is done to-day. The introduction of steel, with its capacity for enduring great tensile strains, has multiplied the demand for tin plates many times. Owing to the low cost and rapidity with which cans and utensils can be turned out with stamping machinery the old trade of the tinsmith is of very much less importance than in former times, when large quantities of plates were made up into what is known as pieced work.

The principal uses of the tin plate are for all sorts of stamped or pieced ware, for decorated boxes, for the canning of fruit, meat, salmon, vegetables, condensed milk, butter, oils—especially petroleum. The oil district of South Russia and the Standard Oil Company are the largest consumers in the world. A very important use, too, is that for roofing purposes. The plate is then made in the form of terne sheets, which are sheets coated with a mixture of tin and lead. The composition of terne is varied very much by different manufacturers. A good mixture is about 3 of lead to 1 of tin.

For roofing purposes plates are extensively used in the United States of America, in Russia, and in the Danube district. For the United States roofing plates are made in sizes 14 x 20 and 28 x 20 inches, for Russia 28 x 28 inches, and for the Danube 29 x 58 inches. These are first seamed together, so as to make long strips the length of the roof from top to bottom of the gable, the several strips of seamed sheets being fastened to the close boarding of the roof with nails in a very ingenious manner, so that no nail passes through the sheets; the long strips are then seamed together, making the whole compact and rain proof. Such roofs are by no means unsightly, and if the sheets are heavily coated, there is no reason why terne roofs should not be used with advantage in this country. In addition to sending out goods in the form of tin and terne plates, the manufacturer has to supply large quantities of material in the form of black plate—that is, as steel or iron sheets in various states of finish according to their uses. Thus enameled ware is made from black plate pickled and close annealed. Special black plate is also produced for fenders, trunks, fry pans, front forks and mud guards of cycles, and countless other uses.

The principal raw materials of the tin plate manufacturer are tin, imported from the Straits Settlements, and the tin bar, a bar of Siemens or Bessemer steel of

* Paper read before the Graduates' Association of the Institution of Mechanical Engineers of England.

any convenient length, and from 7 to 9 inches wide, the weight per foot run of the bar varying according to the size and gauge of the plate to be manufactured from it. The author has called the tin bar raw material, because it is the point from which tin plate making proper begins. Some tin plate works have their own steel works attached, but the majority of manufacturers are content to buy their bars in the open market, provided they can obtain them clean and guaranteed to stand certain specified strains. In the early days of the industry common qualities were made of puddled iron, and were known as coke plates; the better qualities were made of charcoal iron and were called charcoal plates.

The manufacturer at that time made the sizes which suited him best, and the tinsmith had to cut his patterns and make his articles in such a way that the standard sizes could be used with least waste. The chief standard size was originally known as IC (that is, one Common); this was a box of 225 sheets, measuring 14 x 10 inches, and weighing in all 1 cwt. To suit the requirements of consumers wanting plates of greater thickness, plates were made of the same size, but 25 per cent. thicker—that is, each box weighing 140 pounds—and was known as IX (that is, one Cross); the next stronger thickness was IXX, and was 21 pounds heavier than IX, and so on up to eight or ten crosses. Each additional cross after the first denoted that the plates were 21 pounds heavier than IX, which weighed 140 pounds, as in the table below:

	Inches.	Sheets.	Pounds.
IC.....	14 x 10	225	112
IX.....	"	"	140
IXX.....	"	"	161
IXXX.....	"	"	182

The second standard size of early days was what is known as Common Double (CD). In this case the sheets were 17 x 12½ inches, and 100 sheets weighed 98 pounds, and, as before, to denote thicker plates of this size crosses (X) were added, XD being again 28 pounds per box heavier than CD, and each additional X marking an increase in weight of 21 pounds. Thus:

	Inches.	Sheets.	Pounds.
CD.....	17 x 12½	100	98
XD.....	"	"	126
XXD.....	"	"	147
XXXD.....	"	"	168

There was a third intermediate size, 15 x 11 inches, 200 sheets to the box, weighing 100 pounds, known as Common Small Doubles or Common Middles, but these are to-day practically obsolete; they are only called for by certain Government departments and railway companies.

The terms IC, IX, CD, XD, &c., still have a distinct commercial meaning and represent different substances, although in all cases the standard has been reduced about 4 per cent. from the weights which these originally signified, the width of the sheet being doubled, and the number of sheets per box being halved. Thus:

	Inches.	Sheets.	Lbs.		Inches.	Sheets.	Lbs.
IC.....	14 x 20	112	108	CD.....	17 x 25	50	91
IX.....	"	"	136	XD.....	"	"	122
IXX.....	"	"	157	XXD.....	"	"	143

The modern manufacturer, with his Continental trade as against the old American trade, has to work to many other sets of gauges. Thus he is prepared to make sheets:

1. To the tin plate gauge as expressed by the signs IC, IX, CD, XD, &c.
2. To the millimeter gauge.
3. To so many thousandths of an inch thick.
4. To weigh so many ounces per square foot.
5. To weigh so many grams per square meter.
6. To any other recognized gauge, such as the B. W. G., Board of Trade standard gauge, Stubbs gauge, &c.

Further he does not confine himself to plates 14 x 20 inches, but makes any size his mills will turn out. A mill suited to ordinary tin plate work will not roll to advantage sheets larger than 24 x 50 inches, 22 x 58 inches, or 20 x 60 inches. Large plates become a strain on either the men or machinery.

For larger sheets special mills with more furnace accommodation, thicker rolls, and more engine power are constructed.

Thus a 40-inch mill would roll sheets 34 x 70 inches, and a 48-inch mill would roll sheets 40 x 80 inches, or 36 x 120 inches.

In an ordinary mill the handiest sizes are found to be: 22 x 44 inches; 21 x 46 inches; 20 x 48 inches; 18 x 54 inches; 17 x 56 inches, and the like, although there is no recognized standard.

The first consideration of the manufacturer on receiving an order is to get a satisfactory tin bar. In ordering the tin bar the most important factor, which governs the length and thickness of the finished plate, is the weight per foot run of the bar. Thus in making plates 14 x 20 inches by 30 B. W. gauge—that is, by the tin plate gauge IC substance—the first question to be decided is in what way the plates shall be rolled. Thus

they might be made any length or width which is divisible by 14 inches or 20 inches, and the thickness of the plate might be arrived at by rolling on eights, fours, doubles, or singles. That is to say, the article as passed from the mill may consist of eight sheets rolled tight together of the required length and width, of four or two sheets in the same condition or of the single sheet. In this case, to make a plate 14 x 20 inches by 30 gauge, the sheets will probably be made with least waste if rolled 20 x 56 inches and the thickness of the plate will best be arrived at by finishing the pieces on "eights"—that is, the finished piece passed from the mill will consist of eight sheets 20 x 56 inches rolled tight together.

The tin mill consists of two pairs of rolls, known as the roughing and finishing rolls. The bottom rolls are coupled direct to the main shaft of the engine, while the top rolls revolve on the bottom ones. The equipment of the tin mill also consists of two furnaces where the pieces of bar may be heated, doublers—shears and squeezers and mill shears.

It is usual to have two, three or four mills lined up and driven by one engine, the auxiliary machines, such as shears, squeezers, &c., for each mill being driven off the main shaft.

The rolls are of highly chilled cast iron with an extremely hard surface, generally of about 19 inches in diameter with 13-inch necks, and varying in length according to the work they have to do. Thus rolls 28 inches long will work sheets from 18 to 24 inches wide by any length, while 38-inch rolls will work sheets from 27 to 34 inches wide. The bottom roll of the mill is connected direct to the main shaft, but the top roll is free to move up and down between the standards of the mill. This roll is kept down to its work by means of steel screws and boxes fixed in the upper part of the standard. These screws are manipulated by the roller man as he feeds his piece into the rolls and the pressure on the rolls is so adjusted that the plate leaves the rolls accurate as regards length and consequently thickness.

The rolls must be kept with some care, and will require turning up about once a week, an operation which takes from two to four hours per mill. To effect this, a slow motion must be fitted to the mill, so that the speed of the rolls may be reduced for this operation.

The piece of bar cut to the required length is first heated to a dull red heat and then passed to the roller man, who puts it through the roughing rolls, the behinder, a lad standing behind the rolls, passing it back to the roller man, who sends it through the rolls in the same way five or six times. It is then passed back to the furnaceman, and charged in the fire again. After reheating, the plate is rolled again in a similar manner—this time in the finishing rolls, and if of a very thick gauge, to be finished on singles, it will now be drawn to the required length and passed from the mill. But the plate at this stage is too thick for the majority of uses, and so requires doubling. This is the doubler's work. He folds the plate over and then puts it under a squeezer. This is simply a cast iron plate, receiving its motion from the main shaft, which rises and falls from a fulcrum, and coming down on an iron table squeezes down the piece placed on the table, so as to flatten it where it has been doubled over. This is necessary to enable the doubled end to enter the rolls on the next rolling. The doubled piece then goes back to the furnace, after which it is again rolled, and if finished on doubles it is drawn to the required length on this rolling.

If finished on fours or eights the piece must be again doubled, but this time the doubler has to do more than double, he must also shear off what is known as "the curled end;" that is to say, the end at which the first, not the new, doubling was made, so as to give four free ends at the back of the plate as it goes between the rolls. It is then reheated and once more rolled, this time on fours. If finished on fours it is drawn to the required length, the pressure on the last two "licks," or passes through the rolls, being carefully adjusted by means of the screws. If the piece is to be finished on eights it must again be doubled and squeezed; once more the curled end must be shared off, and then, after reheating, it can be rolled out to the required length in the same way as before.

As finished from the rolls the piece will consist of one, two four or eight sheets rolled tightly together. It will be an inch or two longer and broader than required and will have rough jagged edges. From the rolls the piece is passed to the shearer, who cuts it up to the finished size; or rather a trifle smaller than the final finished size to allow for the extension of the plate when passed through the cold rolls later on. From the shearer the piece passes to the opener's bench, where the plates are rapidly torn apart by the openers and loaded on trolleys for conveyance to the next process, the pickling machine.

These sheets are now in the form known as "hard from the mill," and for some purposes, such as shovel plates, are ready for use.

For certain purposes plates in this finish are careful-

ly annealed, and are then ready for use in making galvanized buckets and other similar work. For other purposes the plates, as passed from the opener's bench, are cold rolled and then annealed; such plates are used for trunk making. But for tin plate making proper these sheets "hard from the mill" have to go through many more processes. In the course of rolling and cooling the plates have become covered with an oxide which cannot be tinned, and so must be removed by pickling. The plates are therefore packed in gun metal racks and plunged into a bath of sulphuric acid, where they remain for about five minutes. The rack containing the plates is suspended in the acid from a cross bar, which is raised by steam through a height of about 2 feet, when the steam is exhausted and the bar with the rack drops in the tank of acid to be raised again. In this way the plates are kept in constant motion in the acid. When removed from the acid, the plates are suspended in the same way in a similar bath of water. The effect of this pickling is that the acid has eaten its way under the oxide, which remains on the plates in the form of a greenish black slime. This slime is removed by annealing. After pickling, the plates are packed in the annealing pots, and roasted in the annealing furnace until the slime is removed. This takes about ten hours, after which the pots are taken out and allowed to cool slowly. The annealing pots before roasting are made air tight by filling up any joints or cracks with sand. The plates are now in the form known as pickled or annealed black plate. They are of a silvery whiteness in the middle with discolored edges; and in this form enormous quantities are exported for stamping and enameling.

The plates coming from the annealing oven are considerably buckled, and further have a somewhat rough surface. This rough surface, which is so useful in enameling work, would make a very poor plate if tinned in this state. Before tinning the plate must be polished, and to this end it is passed several times through the cold rolls. This cold rolling polishes the plate satisfactorily, and, of course, lengthens it a trifle, but as the plate was sheared in the mill a trifle short of the required length it is now, on leaving the cold rolls, true to size. This cold rolling has not only polished the plate, but it has hardened it very much and has made it brittle. Consequently the next process must be in the annealing furnace once more; there the plates are roasted until they have reached a dull red heat; they are then brought out and allowed to cool slowly. The plate, as brought the second time from the annealing furnace, is known as black plate p. cr. and ca.—that is pickled, cold rolled and close annealed ready for tinning.

But it is necessary that the plate should reach the tin pot absolutely clean, without dust or grease. To attain this end, the plates are once more pickled in very dilute sulphuric acid, and after being washed in water are passed to the tin house, where they are kept in water until used in the tin pot.

In the early days of tin plate making the iron sheet was merely dipped in a bath of tin and allowed to take up just as much or as little metal as it would.

Now, however, the coating of tin must be regulated with much greater nicety, and the manufacturer must know to within 2 ounces how much tin is used per hundredweight of plates. The amount of tin varies up to about 10 pounds per hundredweight of plates. The tinning set consists in its simplest form of a tin pot, or iron bath filled with molten tin, and a grease pot filled with palm oil and containing a tinning machine.

The tinning machine is an arrangement of steel rolls about 4 inches in diameter, revolving in an iron frame, whose function it is to squeeze from the plate all superfluous tin.

The pace at which these rollers revolve can be varied within certain limits, and the pressure exerted between the rolls is capable of adjustment by means of springs and screws, so that the amount of tin left on the plate can be regulated with considerable accuracy. The steel sheet is dipped into the molten tin, through a flux of chloride of zinc, and from the bath of tin it passes up through the rolls of the tinning machine, which is working in the grease pot. On emerging from the rolls of the tinning machine the plate is caught up in a claw and carried to a rack, where it is allowed to stand for a moment for the tin to set, after which it is rubbed in fine bran to clear away all traces of oil. The plate only requires now to be dusted before being sent to the assorting room. On the assorting table the sheets are carefully picked over by experienced men, the defective sheets being packed separately from the perfect plates. The defective sheets are again picked over into waste and wastewaste. In plates of common coke quality the primes run from 80 to 90 per cent., with 17 to 9 per cent. of wasters and 3 to 1 per cent. of wastewaste.

In the heavily tinned "best charcoal" plates the assorting is much finer; plates are thrown wasters for much more trifling defects. In this quality primes run from 40 to 80 per cent. of the whole. In best plates

wasters vary according to size, the smaller the sheets the higher the percentage of primes.

The defects to which the plates are liable are: Round corners—that is, plates not full to size; ragged edges; pinchers—that is, the steel has lapped over in rolling; stripes and other untinned spots; bad surface marks, and plates improperly pickled. Stripes and other untinned spots are the general defects due to the difficulty of obtaining clean steel and clean coal.

From the assorting room the plates are weighed and reckoned, and packed in elm or birch boxes ready for shipment.

Sheet Metal Furniture.

The Art Metal Construction Company, with factories at Jamestown, N. Y., and St. Louis, Mo., and branches in ten of the more important American cities, issue a series of handsome catalogues illustrating and describing their product, consisting of sheet metal interior furnishings as distinguished from wood, in the line of counters, partitions, shelving, card index and slip cabinets, librarians' cases, ornamental bookcases, letter file cabinets, steel vertical files, desks, tables, wardrobes, lockers, roll top desks, typewriter desks, newspaper and periodical racks, museum and art bookcases, display stands and cabinet work of all kinds, in metal. The extent to which this ever increasing type of office helps is now used is indicated somewhat by the character of the buildings in which the company's sheet metal furnishings have been installed, including many public edifices in National, State, county and municipal governments as well as large business corporations, &c. In this category may be named the file rooms of the Senate, Supreme Court, Patent Office, Library and House of Representatives at Washington, State houses of 12 States, court houses and city halls in leading American cities, together with banks, insurance, railroad and telephone companies, many of the details of which are illustrated and described in the various catalogues published for gratuitous distribution. The adoption of sheet metal for cabinet work likewise reveals the marked progress made in manipulating sheet metal, which for this work is principally high grade rolled steel. A noticeable feature of the work is the treatment of corners, edges, &c., the elegant hard, smooth finish, as a rule, being fine baked enamels, relieved by brass and bronze electroplating in any effect. There is also accomplished by the substitution of steel for wood a maximum of strength and minimum of weight, the protection of valuable archives and records against fire, reduced insurance costs and an enhanced appearance from an æsthetical standpoint. A factor in the development of this industry has been the increasing cost of wood and the tendency to a decreasing cost of steel, together with the great improvements in the kind of machinery demanded for the scientific manipulation of sheet metal.

FLASHINGS.

THE four mills at the Irondale plant of the American Tin Plate Company, at Middletown, Ind., which had been shut down for repairs, resumed operations on Monday. It is said that there will be no general closing down of this plant during the summer, but that all the mills will be kept running steadily.

ACCORDING to the representatives of the American Can Company, the amount of business now being transacted by the company is considerably larger than it was a year ago at this time. The statement is made that the company are carrying on the policy of reducing the number of their plants. Originally these consisted of about 90 separate factories. These are now being reduced to about 40, and it is understood that a further reduction to about 30 will be made. The company are building a very large plant at Cleveland, Ohio, at which several of their smaller works will be concentrated.

RINALD BROTHERS, 1142 to 1146 North Hancock street, Philadelphia, Pa., are sending out a neatly prepared booklet in the interests of their Porcelain Enamel Paint. This product, it is explained, is a Paint only in so far as it is applied like one. It is actually a liquid porcelain,

which may be cleaned with soap and chemicals and is as durable and impervious as glass. It is recommended for use for all purposes in which extra fine work is desired. The manufacturers also make what they term Bessemer Paint, which is claimed to be an absolute protection against rust for galvanized iron or tin roofs and iron structural work. In order to make this Paint adhere properly to tin and galvanized iron the surface should be sponged thoroughly with a 3 per cent. solution of sulphuric acid, to be followed immediately by copious washing with clean water, in order to remove all oil or grease. If Bessemer Paint is well applied in two coatings, it is asserted that a thoroughly effective covering will be furnished to the metal. The firm also manufacture a line of Paints for special purposes, such as Ice Pipe Paint, Radiator Paint and Acid Tank Paint.

THE BRITISH BOARD OF TRADE returns of the exports of Tin and Terne Plates from British ports in the month of June, 1902, show that 4635 tons were shipped to the United States, as compared with 6540 tons in the preceding month and 5470 tons in June, 1901. For the six months ending June 30, 1902, the total shipments of British Tin Plates to this country amounted to 37,740 tons, against 24,253 tons in the first half of 1901. The total Tin Plate shipments from Great Britain in the first six months of this year were 149,939 tons, an increase of nearly 25,000 tons over the shipments for the first half of 1901.

THE PADUCAH CAN COMPANY of Paducah, Ky., have been incorporated by G. R. Davis, R. C. Davis, J. K. Bondurand and C. E. Dennis, to manufacture a patent Oil Can.

THE DAVID LUPTON SONS COMPANY have been organized in Philadelphia, with a capital of \$325,000, for the purpose of manufacturing Skylights, Cornices, Conductor Pipe, Eave Trough and a general line of Sheet Metal Specialties.

JAMES C. WYCKOFF, Tin and Sheet Iron worker, of Raritan, N. J., who met with an accident some weeks ago which laid him up, has now recovered sufficiently to be able to attend again to business.

THE UNITED STEEL COMPANY of Canton, Ohio, were incorporated this week under the laws of the State of Delaware, with a capital of \$500,000, to manufacture Steel, Coke, &c.

G. L. COLBURN, well known to the Iron and Steel trade of New England, has associated himself with Fitz, Dana & Co., 110 North street, Boston, and is traveling in their interest.

AT CANTON, Ohio, the plant of the Carnahan Tin Plate Company is in full operation. The Sheet mill of the Stark Rolling Mill Company has been idle for a couple of weeks undergoing repairs. The Canton Works of the American Sheet Steel Company have been idle for some time, and there are no immediate prospects of resumption at this plant.

TWELVE mills at the Greer Works and 20 mills at the Shenango Works of the American Tin Plate Company, New Castle, Pa., have been started up.

THE AMERICAN CAN COMPANY, New York, deny the report that they intend to erect a Tin Plate plant at Chicago. The company will, however, make a number of improvements to their plants in that city.

THE latest advices from the other side indicate that the settlement of the wage scale in the Welsh Tin Plate trade for the next 12 months is practically assured. At the last meeting of the Conciliation Board, the only question left in dispute was that of payment for "doubles." At a recent meeting of the Wages and Dispute Board, held at Swansea, the men agreed to accept payment by the area on "doubles," under certain conditions. It is regarded as almost certain that at the next meeting of the Conciliation Board a final settlement will be effected.

THE CINCINNATI PUNCH & SHEAR COMPANY, Cincinnati, Ohio, report business to be in a very healthy condition. Orders are not piling up at the rate they did a year ago, but are coming in evenly and steadily, keeping abreast of the capacity to produce them. Shipments

are scattered to all points of the country. The largest contract on hand at present is one for the complete outfit of Shears, Doublers, Strap Cutters and other tools for a new rolling mill at Louisville, Ky.

THE improvements to be made in the Tin Plate mills of the Lalance & Grosjean Mfg. Company, at Harrisburg, Pa., will consist of a 15-ton crane, five new annealing furnaces, two new gas producers, and 50-kw. and 75-kw. electric dynamos.

Hero Emery Grinder No. 30.

In the accompanying engraving we show what is known as the Hero emery grinder No. 30, designed for use in shops and establishments where power is available, and having a universal sliding carriage for sharpening plane irons, chisels and other tools for cutting wood. The grinder is manufactured by the Robertson Mfg. Company, 38 Greenwood place, Buffalo, N. Y., who state that with it any bevel or angle can be attained by adjusting the different connections. The claim is made that by the use of this

Hero Emery Grinder No. 30.

device tools can be ground more perfectly than at the factory where they are made, and with this method as employed in connection with the company's No. 20 grinder the bevel is slightly concave, and to finish on oil stones the edge is brought up with very little work. The machine, which is furnished with extra tool rest for ordinary grinding, has a spindle of 13-16 steel milled down on the ends to $\frac{5}{8}$ inch for wheels having turned collars with right and left hand nuts. The countershaft is furnished with tight and loose pulley, $2\frac{1}{4} \times 5$ inches; with drive pulley 2×10 inches, and a shipping lever arranged to work from right or left hand side.

THE STANDARD SANITARY MFG. COMPANY have recently opened a large warehouse at Thirty-eighth street and Eleventh avenue, New York, where they will carry a full line of goods of their own manufacture for the accommodation of the jobbing trade in Greater New York and the nearby cities. They expect to carry a complete line of everything they make, consisting of all sizes and styles of Bathtubs and a full line of their small ware. At the present time the stock consists chiefly of Bathtubs, but they will from time to time notify the jobbing trade of such articles as are added to their stock, so that they can avail themselves of the opportunity of obtaining goods promptly. All goods will be sold f.o.b. warehouse.

HERCULES FLOAT WORKS, Springfield, Mass, manufacturers of Seamless Copper Floats for high pressure work, advise us that they intend to add to their product a line of high grade plumbing goods, including Flush Valves and Self Closing Basin Cocks. Their shop is now running 14 hours a day on their regular line, but they state that their facilities will be increased to provide for the new business.

The Production of Mica in 1901.

The United States Geological Survey has completed a report of the production of mica in the United States in 1901, compiled by Joseph H. Pratt, from which it appears that the total output of sheet mica during the year was 360,060 pounds, valued at \$98,859 and of scrap mica, 2171 short tons, valued at \$19,719. In 1900 the production of sheet mica was 456,283 pounds, valued at \$92,758, and of scrap mica, 5487 pounds, valued at \$55,502. The relatively small production of mica last year can be accounted for by the low price maintained for sheet mica, by the uncertainty of the occurrence of the mica in the veins, and by the large number of small purchasers who are entirely dependent upon one small mine, and who, when the mica in this begins to give out, or is poor, have not the means to carry on much dead work, and have no other deposit to help fill out the deficiency. The importations of mica from Canada and India at a low price tend also to curtail the production of mica in the United States. This is especially true of mica imported from India, which can be mined and landed in this country at a lower price than in some cases it can be mined for in the United States. Although mica has been found in many of the States of the Union, it was only produced in 1901 in New Hampshire, New Mexico and South Dakota, by far the larger amount being obtained from North Carolina.

There has been a decided decrease in the use of mica for cutting into sheets of the various sizes which are used for stoves, chimneys, incandescent lights, &c.; but there has been a large increase in the quantities of the smaller pieces of mica that are cut by machinery into small circular disks 1 inch in diameter, and into rectangular pieces $\frac{3}{4}$ inch by 2 inches, which are used for insulation purposes and for electrical apparatus. Some of the small clear pieces of mica from the cutting of the large sheets are split very thin and rearranged and cemented and firmly pressed together, forming large sheets, which are then cut into the various shapes and sizes desired. Sheets made in this way are known as micanite. For some purposes these large sheets of micanite answer fully as well as the natural sheets, and are, of course, much cheaper. The waste or scrap mica which is not suitable for any of the above purposes has a value, when ground, in the manufacture of wall papers, lubricants, &c.

Another use for scrap mica that has been devised during the last few years is in the manufacture of covering for boiler tubes and steam pipes in general. The scraps of mica are not ground, but are broken to approximately the same general dimensions, about $\frac{1}{2}$ x $\frac{1}{4}$ inch. These pieces of mica are arranged with their longest direction and face parallel to a wire net coil, and then pressed into the shape of the pipe or tube, the layer of mica being kept tightly in place against this coil by means of heavy canvas. This kind of boiler tube covering can be made cheaply. The commercial value of this scrap mica, which is from \$8 to \$10 per ton delivered at the railroad, has made it possible to work some of the mica mines that would otherwise have been unprofitable, for in some cases the waste scrap mica represents 75 to 95 per cent. of the mica obtained.

Of the production of sheet mica in 1901, North Carolina is credited with 266,160 pounds; New Hampshire with 65,800 pounds; South Dakota with 25,000, and New Mexico with 3100 pounds. Idaho, Maine, Nevada, Rhode Island and Virginia were producers of mica in 1900, but reported no production during 1901, and in the other States, with the exception of North Carolina, there was a very noticeable falling off in the production. In North Carolina there was a decided increase in the production of sheet mica. Since 1897 there has been a constant increase in the amount of mica entered for consumption in the United States. Under the Dingley Tariff Act in 1897 imported mica is designated as "unmanufactured," and "cut or trimmed," and a specific duty of 6 cents per pound is imposed upon the former, and 12 cents per pound on the latter, with an additional 20 per cent. ad valorem on it. The imports for 1900 and 1901 were as follows:

1900.—Unmanufactured, 1,892,000 pounds, valued at

\$290,872; cut or trimmed, 64,391 pounds, valued at \$28,688; total, 1,956,391 pounds, valued at \$319,560.

1901.—Unmanufactured, 1,598,722 pounds, valued at \$299,065; cut or trimmed, 78,843 pounds, valued at \$35,989; total, 1,677,565 pounds, valued at \$335,054.

Building in Chicago.

The high prices of building materials are said to be the cause of lack of work by Chicago architects, who state that much work is being deferred until prices are lower. From every indication it would appear that the time of beginning construction is very remote, says the *Construction News*. It is not believed that prices will be lower for maybe years to come. Good evidence of this is to be found in the present active state of the steel market. Notwithstanding the activity of the market last year, when it was thought it had reached the highest point, so far as output was concerned, the output for the first half of this year has been stupendous, and there is not the slightest indication that there will be any let up for many months to come. Construction is going on at an unprecedented rate in all parts of the country, and as one class of buildings makes a demand for another class it is believed that it will continue for many years. Prosperity is not an unknown thing in this country, but it is simply that the memory of the people is so short that they soon forget a long period of depression or a long period of prosperity, and taking the immense development of this country into consideration, there is no reason why any one should express amazement at the present prosperous condition of the building trade or doubt for a minute that it will continue for a long time.

Antimony in 1901.

The chief use of antimony, says Joseph Struthers in *The Mineral Resources of the United States*, is for making alloys with lead, tin, zinc and other metals. The addition of a small quantity of antimony to lead hardens it and causes it to expand at the moment of solidification, molding the casting with clean, sharp faces, which is of special value in the manufacture of type. The most important alloys of antimony are type metal, composed of lead and antimony, with or without the addition of tin; hard lead, produced in refining antimonial lead, containing generally about 25 per cent. of antimony; Britannia metal and pewter, used extensively for table ware, the former being an alloy of tin, with from 10 to 16 per cent. of antimony and 3 per cent. of copper, and the latter an alloy of tin with a smaller amount of antimony; and antifriction metal, also called white metal and babbitt metal, which consists of antimony and tin, with an addition of small quantities of lead, copper, zinc, bismuth and nickel.

During 1901 the domestic production of antimony ore amounted to only a few hundred tons, derived from Idaho, South Dakota and California. There are a number of antimony deposits in other Western States, but on account of the present condition of the industry and the high transportation charges to smelting centers they cannot be operated with profit.

The sources of supply of antimony consumed in the United States are four in number—viz., hard lead, derived from smelting of foreign and domestic lead; imported regulus or metal, imported antimony ores and domestic antimony ores, these being given in the order of their importance. The amount of hard or antimonial lead produced from foreign or domestic lead ores in 1901 was 17,878,000 pounds, containing approximately 4,469,000 pounds of antimony. The amount of antimony metal imported during 1901 was 3,674,900 pounds. The aggregate amount of antimony available as metal or in alloy from the above mentioned sources in 1901 is estimated at 8,971,800 pounds, valued at about \$919,614. The amount produced from domestic and foreign ores in 1901 was 414 tons, valued at \$84,870. Most of the imported antimony came from Germany, France, Italy and Austria-Hungary, with a small amount from Japan. The consumption of antimony in the United States last year is placed at 4486 tons, as against 6053 tons in 1900 and 4056 tons in 1899.

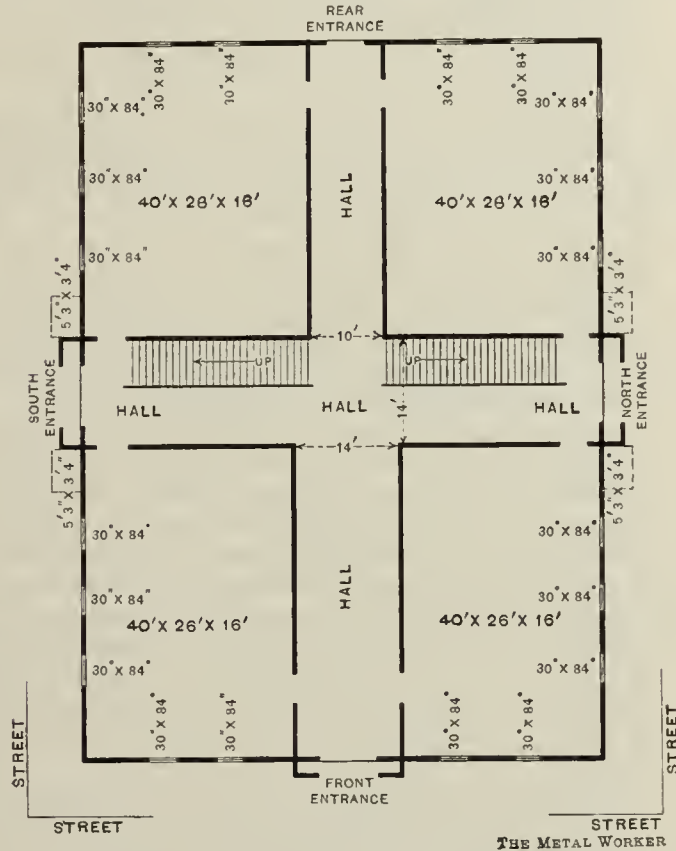

THE LETTER BOX.

Inquiries in regard to practical questions of general interest are invited, in reply to which we shall be glad to receive suggestions and information from our readers.

Correspondents are requested in all cases to give their names and addresses, which will not, however, be published or disclosed without their consent.

WANTS HELP TO HEAT A SCHOOL.

From C. S., Celina, Ohio.—Will *The Metal Worker* kindly invite its experienced furnace readers to present a successful plan for heating and ventilating a 12-room school building with hot air, the plan of the first floor of which is presented herewith and which is practically the same for the different floors, the building being three stories high? There are five windows in each room, having a glass surface of 30 x 84 inches and a double window 60 x 84 inches in each end of each of the upper halls. The first floor has doors instead of windows, although there are glass transoms over the

Wants Help to Heat a School.

doors. The rooms each have a ceiling 16 feet high. The flues now in the building cannot be used on account of being so small, but four flues can be built at the north and south entrances, as shown by the dotted lines. But there is only 5 feet 3 inches space between the offsets at the entrance and the edge of the first window. A portion of the front hall on the second floor is inclosed for the principal's office.

Note.—We hope that our furnace readers who have had experience in this kind of work will render what assistance they can to this correspondent. In the meantime we would suggest that he consult *The Metal Worker* of April 1, 15 and 29, 1899, which contain prize essays on school house heating.

COPPER FOR SMOKE PIPE.

From A. B. C., Utica, N. Y.—In reply to the inquiry of "W. J." in *The Metal Worker* of July 12, I give the following experience with a copper smoke stack: About 18 years ago I made a smoke stack from 20-ounce hard rolled copper, 8 inches in diameter and 12 feet high, with ordinary cap at the top. This was placed inside of a brick chimney 8 inches square and 12 feet high. The stack looked bright and solid for about six months, when it suddenly collapsed. What copper was left from the stack was about the thickness of tissue paper. While the outside was of a bright color, the inside was of a dark brown color. The chimney was used for a 6 horse-power boiler with anthracite coal as fuel.

WHAT WILL MAKE PUTTY HOLD?

From E. F. A., Shawneetown, Ill.—Will *The Metal Worker* or some of its readers be kind enough to tell me how to make putty adhere to woodwork and windows. The glass is 14 x 20 inches. The first time the putty came off I reprimed the sash, but with no more lasting results.

Note.—We hope our readers will not leave this correspondent without assistance. In the meantime we would suggest that the glass should first be securely fastened to the muntings by means of glaziers' points. Then the putty should be applied, but the woodwork should have been previously painted with a good white lead paint. After the putty is applied, if it is protected with another coat of paint the oil will not be so likely to bake out of the putty and leave it a soft powder, or, through lack of oil, cease to adhere to the wood.

HOW TO MAKE A SPARKING COIL.

From Amateur, Cincinnati.—Will you kindly advise me through the Letter Box how to make a sparking coil sufficiently strong to generate a spark that will light paper or cloth? How many ordinary dry batteries would be required to use for this purpose?

Answer.—For a sparking or induction coil strong enough to ignite paper or cloth make a magnet core of a bundle of soft No. 20 iron wire $\frac{3}{4}$ inch in diameter and 6 inches in length, wrapped in two thicknesses of strong paper laid with shellac varnish for insulation. Put thin wooden spool heads on the ends of the core wrapping, fastened with shellac varnish. Then wind the spool with four layers of No. 16 cotton covered copper wire, with shellac varnish on each layer, passing the wire ends through holes in the spool head at the level of the last layer. Cover the coil with four thicknesses of wrapping paper well shellacked for insulation from the secondary current.

For the secondary coil, wind with 12 ounces of No. 34 double silk covered copper wire, commencing by passing the end of the wire through a hole in the spool head close to the paper winding of the primary coil. Cover each winding of the secondary coil with two thicknesses of wrapping paper, well shellacked to make the insulation perfect against short circuiting of the secondary current. Special care in closing each paper winding against the spool heads is very essential to prevent burning out. Dry the shellac varnish as the work proceeds.

With 10 medium sized dry batteries in series, a $1\frac{1}{4}$ -inch spark may be obtained between wire terminals or a $\frac{1}{2}$ -inch hot spark between brass balls of $\frac{3}{4}$ inch in diameter. With eight Edison-Leclanche cells and a vibrating attachment a brilliant spark effect may be had between the brass balls.

WHO MAKES HINKLE CARPET STRETCHERS?

From George A. Hawley, Canaseraga, N. Y.—Will you please insert in the Letter Box the following inquiry? I have a carpet stretcher with "Hinkle, Indianapolis, Ind." cast on it, and am anxious to know who makes this stretcher.

EMIL SCHNEIDER, 306 South street, Newark, N. J., is offering Schneider's Soldering Salts for use in soldering tin, zinc, copper, brass, iron, &c. These Salts are put up in bottles of $\frac{1}{2}$, 1, 2 and 5 pounds. For use, the Salt is simply dissolved in water in proportions suitable to the strength required. Mr. Schneider is also manufacturing a Soft Soldering Fluid for use with all kinds of metals. This Soldering Fluid is put up in two grades, denominated "Triple Strength" and "Extra Concentrated." His Hard Soldering Fluid is especially adapted for use with gold and silver. It is also applicable to copper and brass. Another product of interest to the trade is a nonpoisonous Soldering Grease for soldering copper wires. He is also the maker of a Brazing Powder, which is claimed to be especially effective for brazing purposes. H. Weiss & Co., 20 Cliff street, New York, are selling agents for these products.

TRADE REPORT.

MARKET SUMMARY.

Pig Tin is dull and weak, ruling $\frac{1}{2}$ c. lower in price.
Copper rules weak, with a light demand.
Pig Lead is dull and firm in price.
Spelter continues scarce and strong, with light demand.
Antimony is quiet and unchanged.
Nickel is in good demand and without change in price.
Aluminum is firm and in good demand.
Tin Plates are quiet, with prices unchanged.
Black Sheets are quiet, except for the heavy gauges, and the market is without change.
Galvanized Sheets are in better demand and prices are firmer.
Old Metals are quiet and unchanged.
Foundry Iron is very scarce and prices nominal.
Sheet Copper is in fair demand and firm in price.
Sheet Zinc is firm; demand is moderately active.
Block Tin Pipe is firm and active.
Sad Irons are very active and firm, with a slight advance in price on some lines.
Sash Weights are in active demand, and prices have an upward tendency.
Wire Nails are moving in fair volume, with quotations unchanged.
Cut Nails are unchanged.
Window Glass is quiet but firm.
White Lead is strong, with some scarcity.
Linseed Oil continues firm, with moderate demand.
Spirits Turpentine is moving more freely and rules a shade higher.

METAL MARKET.

NEW YORK, July 25, 1902.

Pig Tin.—The market for Pig Tin has been quiet, with a light volume of business. Only the smaller consumers are buying and that in a hand to mouth way. Prices have declined sharply in this market, as well as in London, the tone at the close being weak, with quotations about $\frac{1}{2}$ c. lower than those prevailing at the date of our last report. Straits Pig in small lots is quoted by jobbers at $29\frac{1}{4}$ c. to $29\frac{3}{4}$ c. per lb. Arrivals so far this month have amounted to 1507 tons, with 3368 tons afloat. The demand for Tin at this time of the year is ordinarily at its lightest, and this, with the weakness in the London market and increasing stocks, has served to bring about a decline in prices.

Copper.—There has been continued weakness in this metal and wholesale prices are a shade lower than last week, the market having continued to sag from day to day. While the consumption of Copper is said to be heavy, it is mainly being supplied by deliveries on contracts placed some time since. Consumers are purchasing very little metal at present prices, the impression being abroad that prices are liable to be lower in the future rather than higher. The situation is considered as decidedly in the buyer's favor, the production being large, as well as the imports, while exports are decreasing. Jobbers quote Lake Ingot in small lots at 13c. per lb., and Casting Copper at $12\frac{1}{2}$ c. to $12\frac{3}{4}$ c.

Sheet Copper.—Manufacturers report a steady demand for Sheet Copper, while prices remain firm on the basis of 18c. per lb. from store. Some of the Copper rolling mills are closed down for their annual repairs and overhaul, consequently the production is at present restricted.

Pig Lead.—Very little life is shown in this market. Buying is on a moderate scale, and prices are unchanged. American Pig in small lots is quoted at 4.45c. to $4\frac{1}{2}$ c. per lb.

Spelter.—This metal is still very strong and advancing with a marked scarcity of spot Spelter. The demand at the same time is very light, otherwise prices would be likely to go soaring to a much higher level. Jobbers quote good Western brands in small lots at 6c. to $6\frac{1}{2}$ c. per lb. It is reported that officials of the American Smelting & Refining Company are negotiating for the acquisition of the Clark-Coolidge Zinc and Lead properties in Missouri. No significance is attached to the report in the trade. Even should they acquire these properties they are of so small importance that the situation would remain unchanged. St. Louis advices report that the active call for Spelter continues and prices have reached a higher level.

Sheet Zinc.—The demand for Sheet Zinc is of ordinary proportions, and prices are very firm at $6\frac{3}{4}$ c. per lb. for 600-lb. cask lots, and $7\frac{1}{4}$ c. to $7\frac{1}{2}$ c. for smaller quantities.

Antimony.—No change has taken place in this metal, and the demand for it is somewhat limited. Cookson's in small lots, is quoted at $10\frac{1}{2}$ c. to $10\frac{3}{4}$ c. per lb., and Hallett's $8\frac{3}{4}$ c. to $8\frac{7}{8}$ c., and other brands at $8\frac{1}{2}$ c. to $8\frac{3}{4}$ c.

Nickel.—This metal is unchanged. Small lots are quoted at about 5c. per lb.

Aluminum.—The demand for Aluminum continues active and prices are without change. Small lots of No. 1 Ingot, guaranteed 99 per cent. pure, are quoted at 37c. per lb. and 100-lb. lots at 35c.

Tin Plates.—No change worthy of note has taken place in the Tin Plate market during the week. Extreme dullness is the ruling characteristic. Buying is on the smallest possible scale. No large orders are reported, and such business as was done was purely of a retail, hand to mouth character. Prices show no change, jobbers quoting American Bessemer Coke Plates, I C, 14 x 20, in moderate sized lots, delivered at New York and corresponding points, at about \$4.75 to \$4.90 per box. An advance of $1\frac{1}{2}$ d. in the price of Welsh Plates was reported this week, the quotation now being 13s. $4\frac{1}{2}$ d. f.o.b. Swansea.

Sheets.—A fair amount of business in Black Sheets has been placed within the past few days, mainly for the heavier gauges, and a slightly better inquiry for Galvanized Sheets is reported, the tone of the market on the latter being claimed to be stronger. The output of Sheets has been cut down a good deal by the suspension of operations at a number of the mills for repairs and stock taking. Some of these mills will not get started for another two or three weeks, consequently the Sheet product of the country will be materially reduced. Stocks of Sheets at some of the mills and in the hands of some few jobbers are reported to be increasing. For small lots, jobbers quote about 3.70c. on No. 27, One Pass Cold Rolled Soft Steel Sheets, and 4c. to 4.10c. on Galvanized.

Chicago advices are as follows: Heavy Sheets have continued steady, with a fair demand, but there has been no improvement in the call for Light Sheets, which are weak. A report was current that the American Sheet Steel Company have reduced prices, but this was denied. Galvanized Sheets are especially heavy with various discounts made by most dealers. Quotations are unchanged. No. 27 Black Sheets in small lots from store are quotable at 3.45c. to 3.55c., and Galvanized Sheets at 4.70c. to 4.75c. for No. 27.

Old Metals.—The market for Scrap is rather quiet, but prices show little change. Dealers are paying about the following rates for moderate sized lots, delivered at New York or corresponding points:

Heavy Copper.....	per lb. 10 c.
Light and Tinned Copper.....	per lb. 9 c.
Heavy Brass.....	per lb. 8 c.
Light Brass.....	per lb. $6\frac{1}{4}$ c.
Lead.....	per lb. $3\frac{5}{8}$ c.
Tea Lead.....	per lb. 3 c.
Zinc.....	per lb. $3\frac{1}{4}$ c.
Pure Aluminum Sheet.....	per lb. 22 c.

Cast Aluminum.....	per lb.	17 c.
No. 1 Pewter.....	per lb.	18 c.
No. 2 Pewter.....	per lb.	9 c.
11n Plate Scrap, per gross ton.....		\$5.00
Wrought Iron Scrap, per gross ton.....		\$13.00 to 13.50
Heavy Cast Scrap, per gross ton.....		12.00 to 12.50
Stove Plate Scrap, per gross ton.....		8.50 to 9.00
Burnt Iron, per gross ton.....		7.00 to 7.25

THE PIG IRON MARKET.

NEW YORK.—The Anthracite Coal miners' strike is causing increasing trouble among Eastern foundrymen. They have contracted for all the Iron needed this year, but cannot get it, as the furnaces are running so irregularly, which not only reduces their product but often causes the quality to be much under contract grade. Numerous foundrymen are therefore depending on Scotch, English and German Iron to keep them running. Southern furnace companies have agreed on the basis of \$17. Birmingham, for No. 2 Foundry for the first six months of 1903. Prices of both Northern and Southern Iron are much higher for anything like early delivery than for next year's shipment. Consumers in distress for stock have been known to pay \$25 or more for No. 2 Foundry the past week. For 1903 the following quotations are made: Northern Iron, at tidewater, No. 1 X, \$23.50 to \$25; No. 2 X, \$22.75 to \$23.50; No. 2 Plain, \$22.25 to \$22.50. Tennessee and Alabama brands are quoted as follows: No. 1 Foundry, \$22.50 to \$23.50; No. 2 Foundry, \$21.75 to \$22.50; No. 3 Foundry, \$21.25 to \$21.75.

CHICAGO.—Heavy sales of both Northern and Southern Iron for deliveries during the first half of 1903 have been made during the week. Stove foundries and Pipe works have been among the large buyers, as well as jobbing foundries. The Northern Foundry Iron has been sold mainly on the basis of \$21, Chicago, for No. 2, and the Southern Iron mainly on the basis of \$17, Birmingham, for No. 2. Spot Iron and Iron for early shipment is very difficult to obtain and command a heavy premium. There have been sales of 1200 tons of irregular mixed lots of Foundry Iron at about \$24, delivered. The settlement of the labor difficulties in the Birmingham district has been followed by a more confident feeling. One Southern furnace is reported to have sold its entire capacity up to July, 1903, and other Southern furnaces are demanding all the way from \$17 to \$18 for No. 2 for next year's delivery. Charcoal Iron is especially scarce, and Southern brands have been advanced \$2 per ton. While the following quotations are relatively those current for delivery during the current year, they are little better than nominal, and future quotations will be based upon sales made for next year's delivery, with premiums given on delivery during the current year and on cash transactions:

Lake Superior Charcoal.....	\$25.00 to \$26.00
Local Coke Foundry, No. 1.....	22.00 to 22.50
Local Coke Foundry, No. 2.....	21.50 to 22.00
Local Coke Foundry, No. 3.....	21.00 to 21.50
Local Scotch, No. 1.....	22.50 to 23.00
Ohio Strong Softeners, No. 1.....	24.00 to 25.00
Southern Silvery, according to Silcon.	24.65 to 25.15
Southern Coke, No. 1.....	24.15 to 24.65
Southern Coke, No. 2.....	23.65 to 24.15
Southern Coke, No. 3.....	23.15 to 23.65
Southern Coke, No. 1 Soft.....	24.15 to 24.65
Southern Coke, No. 2 Soft.....	23.65 to 24.15

PITTSBURGH.—A heavy buying movement is going on in No. 2 Foundry Iron for delivery next year, and a large tonnage has been sold on the basis of \$21.75 to \$22, Pittsburgh. Coke is still very scarce, and, further, furnaces in the Valleys have been compelled to bank.

CINCINNATI.—The Pig Iron market shows little change from the conditions of a week ago. The result of the fixing of 1903 Southern Iron on the basis of \$17, Birmingham, for No. 2 Foundry, is seen in the fact that no Iron is now being offered on the basis of \$16.50, Birmingham, which was the ruling price a week ago. The amount of Foundry Iron in sight is nothing beyond a meager dribble, which comes from various sources. Under these circumstances prices are naturally strong and as high as they have been. Offerings of Northern Irons are very scarce, and prices practically unchanged. The market is a good deal of a vacation one at the present time. We quote, f.o.b. Cincinnati, for 1902 delivery as follows, this year's delivery:

Southern Coke, No. 1.....	\$21.25 to \$22.25
Southern Coke, No. 2.....	20.75 to 21.75
Southern Coke, No. 3.....	20.25 to 21.25

Southern Coke, No. 4.....	19.75 to 20.75
Southern Coke, No. 1 Soft.....	21.25 to 22.25
Southern Coke, No. 2 Soft.....	20.75 to 21.75
Ohio Silvery, No. 1.....	24.60 to 25.10
Ohio Silvery, No. 2.....	24.10 to 24.60
Lake Superior Coke, No. 1.....	25.10 to 25.60
Lake Superior Coke, No. 2.....	24.60 to 25.10
Lake Superior Coke, No. 3.....	24.10 to 24.60

CHICAGO REPORT.

Scrap Iron and Steel.—A stronger tone has developed under moderate offerings and a good demand; for some kinds of Scrap dealers are paying an advance of 50c. per ton. The current offerings are bought, in carload lots, Chicago delivery, as follows:

	Per net ton.
Country Wrought Scrap.....	\$14.50 to \$15.00
Machinery Cast.....	12.50 to 13.50
Malleable Cast.....	12.00 to 13.00
Stove Plate (free from burnt).....	9.50 to 10.00
Burnt Iron and Grate Bars.....	8.00 to 9.00
Sheet Iron and Hoops.....	8.00 to 9.00
Plow Steel.....	12.00 to 13.00
Breaking Stock.....	11.00 to 12.00
Old Boilers—whole (Iron).....	9.50 to 10.00
Old Boilers (Iron) cut in single Sheets and Rings.....	12.50 to 13.00
Old Gas Pipes and Boiler Tubes.....	12.50 to 13.00
Cast Borings.....	8.50 to 9.00
Turnings.....	12.00 to 12.50
Horseshoes.....	14.00 to 14.50

Old Metals.—With freer offerings of Copper and no improvement in the outlet the market has been slow and weaker, with Copper Wire, Bottoms and Clips lower. Zinc has been strong and higher. The following prices are being paid by dealers in this market:

	Per lb.
Copper Wire and Heavy.....	10 1/2 c.
Copper Bottoms.....	9 3/4 c.
Copper Clips.....	10 1/4 c.
Red Brass.....	10 3/4 c.
Yellow Brass.....	8 1/4 c.
Red Brass Borings.....	9 1/4 c.
Yellow Brass Borings.....	7 1/2 c.
Light Brass.....	6 3/4 c.
Pipe Lead.....	3.70 c.
Tea Lead.....	3.35 c.
Zinc.....	3.35 c.
Tin Foll.....	21 c.
Pewter, No. 1.....	18 c.
Pewter, No. 2.....	11 c.
Aluminum.....	20 c.

Old Rubber.—The offerings have been moderate and the market has been quiet but steady. Prices paid by dealers are as follows:

	Per net ton.	Per lb.
Garden Hose.....	\$25.00
Air Brake Hose.....	45.00
Rubber Shoes.....	7 c.
Rubber Car Springs.....	5 c.
Inside Bicycle Tubing.....	22 c.
Outside Tubing.....	5 1/2 c.
Black Rubber.....	4 c.
White Rubber.....	8 1/2 c.

Rags.—A slightly better tone has developed for Mixed Rags, the demand showing some improvement, but no change in prices has resulted. Dealers continue to buy liberal offerings at 65c. to 75c. per 100 lbs., Chicago delivery.

Anthracite Coal.—Stocks at the mines are being much reduced, although the demand is only moderate, and the market remains firm with no change reported in labor conditions at the mines. Following are the prices current, subject to a discount of 20c. for shipment made during July:

	Grate.	Egg and Stove.
Chicago.....	\$5.75	\$6.00
Millwaukee, Wls.....	5.75	6.00
St. Louis.....	6.20	6.45
Kansas City, Mo.....	8.25	8.50

I. B. WILLIAMS & SONS, manufacturers of Leather Belting, Lace Leather, &c., advise us that they are fitting up and stocking a complete store for the sale of their goods at 722 Arch street, Philadelphia. They will also handle, in connection with their Leather goods, a full line of Mill, Mine, Railroad and Engineers' Supplies and Power Transmission Machinery. The company, who have branch offices in New York, Chicago and Boston, have opened this Philadelphia agency for the benefit of their customers in that district. They have entered into partnership with Harry S. Huhn and W. J. M. Weaver, both of whom are experienced in the business, and the Philadelphia branch will be under the personal supervision of those gentlemen. They will be pleased to receive at the Philadelphia branch copies of catalogues and price-lists from manufacturers or dealers in lines in which they are interested.

THE HARDWARE TRADE.

The month which is perhaps the quietest in the year, so far as general business is concerned, draws to a close without any important change in the commercial or mercantile situation. There has been no weakening of prices of such a character as to indicate any lack of strength in the market for Hardware and Iron products, and while there has been a natural letting up of the demand the volume of business has been on the whole satisfactory. Crop conditions, notwithstanding unfavorable reports from some sections, are undoubtedly on the whole such as assure great crops, which will serve as the basis of a widespread prosperity. While in the market for Hardware and related goods there is a general recognition of the existence of high prices, as viewed in the light of past experience, the absorbing power of the country and the great volume of goods which are going rapidly into consumption keep stocks all along the line down to what is in many cases an uncomfortably low level, and makes the market to have in general a decidedly strong and confident tone. Careful merchants are watching closely a few spots where weakness is expected sooner or later to develop, and in some of them there are signs that the goods are beginning to feel the effect of competition, which has been encouraged by high prices, and in some cases by the temporary control of the market, as it is called, by leading interests, or by agreements in one form or another between the manufacturers. The development of the producing capacity of the country is finding constant illustrations in the establishment of new plants or the enlargement of existing ones, so that there is scarcely a line in which the ability of the manufacturers to turn out goods has not been materially increased since the beginning of the present prosperous era. All this contributes directly to the activity of trade and the well-being of the people, but has its obvious bearing on the conditions which will prevail when anything occurs to check consumption and to bring about the reaction which must be anticipated. Fortunately all the indications point to a continuance of prosperous conditions and active business during the period upon which the trade is about to enter.

NOTES ON PRICES.

Plumbers' Supplies.—The demand from the city trade is very slack and some falling off in the volume of out of town business is reported by the Plumbing Supply houses. Midsummer dullness and the vacation season are having their usual effect on the trade. Plenty of work is in prospect, however, and with the present strength of prices in all lines, the outlook is favorable for a good and profitable business in the late summer and fall. Most of the orders now coming in are for repair jobs, although a few good sized contracts for material for new buildings are coming into the market. No changes in prices of Plumbers' and Steam Fitters' Supplies took place this week, but strength continues to characterize practically all lines. Iron Goods are specially strong with advancing tendency, in correspondence with the rising condition of the Iron market.

Cast Iron Soil Pipe.—The manufacturers of Cast Iron Soil Pipe and Fittings are putting the local jobbing trade to considerable inconvenience by their inability to fill orders promptly and complete. Four-inch Pipe has completely disappeared from the market, and all that is reaching here from the local foundries is immediately gobbled up by the local trade. The out of town trade is receiving very poor attention on Cast Iron Soil Pipe and Fittings owing to the fact that the local plumber is on the ground and is continually demanding deliveries, and in order to appease him the jobbers are filling his orders before those of the customers who are at a distance and are consequently not able to make their appeal in person. Prices have remained unchanged up to the present. Prices to the local trade which were recently issued have been adopted by the local jobbers, and the indications now are that there will be no change to the

retail trade for some time to come. There is a possibility, however, of the manufacturers being compelled to advance prices to the jobbing trade, owing to their inability to procure Iron purchased at old prices.

Lead Washers.—The Littleford Brothers, Cincinnati, Ohio, under date of July 16, issue a new price-list on Lead Washers. The price is now 20 cents per pound, less the following discounts:

For orders of 10 boxes.....37½ %
For orders of 5 to 9 boxes.....35 %
For orders of 1 to 4 boxes.....32½ %
For orders less than 1 box, list price.

The boxes contain 100 pounds each, and the Washers run 325 to the pound. Terms 30 days net, 2 per cent. for cash in 10 days.

The American Radiator Company, under date of July 21, announced that the Rococo Radiator prices, steam and water, were advanced 5 per cent., to take effect at the close of business on July 19. They say that this change does not affect any of their other styles of Radiators, and does not apply to any of their three-column patterns.

The Walworth Mfg. Company, Boston, Mass., have withdrawn all quotations for Walworth Die Plates and announce that new discounts will be quoted upon application.

Sad Irons.—This line is in active demand, and the market, owing to this fact and the price of the raw material, is decidedly firm. Some of the manufacturers have recently made a slight advance, but others are quoting as before.

Oilers.—The condition of the market in Oilers is represented in the following quotations recently issued by Wm. Vogel & Bros., 37-47 South Ninth street, Brooklyn, N. Y. Terms, 60 days, or 2 per cent. discount for cash in 10 days, f.o.b. New York.

	Discount.
Chace's Pattern Steel Oilers, tin bottoms.....	70 and 10 %
Chace's Pattern Steel Oilers, brass bottoms.....	70 and 10 %
Improved Paragon Steel Oilers, detachable drip cup.....	70 and 10 %
Chace or Paragon Brass or Copper Oilers.....	50, 5 and 2½ %
Automatic Steel Oilers.....	45 and 5 %
Automatic Brass or Copper Oilers.....	35 and 5 %
Engineers' Drip Oilers.....	50 and 5 %
Steel Oil Fillers.....	25 and 5 %
	Per gross.
No. 701, Round Mowing Machine Oilers, steel, in bulk.....	\$5.00
No. 701, Round Mowing Machine Oilers, cop. pl'd, ".....	7.00
No. 701, Round Mowing Machine Oilers, japanned, ".....	6.00
No. 698, Round Mowing Machine Oilers, steel.....	5.00
No. 698, Round Mowing Machine Oilers, japanned, ".....	6.00
No. 699, Oval Mowing Machine Oilers, steel.....	5.75
No. 700, Dome Mowing Machine Oilers, steel.....	5.75
No. 710, Round Mowing Machine Oilers, copper plated, heavy.....	9.75
Comet Sewing Machine Oilers, polished.....	3.25
No. 00, Sewing Machine Oilers, polished.....	3.25
No. 00, Sewing Machine Oilers, japanned.....	3.50
Extra spouts for all Oilers, brass or copper, 15 %; tin, 35 %.	

Sash Weights.—The market for Sash Weights appears to be in excellent condition, and the advances recently made, both in the East and West, are well maintained. Factories generally are short of stock and report a large demand, so much so that it is impossible for them to make as prompt shipments as usual. In view of this condition of things, even in the dull season, it is thought not unlikely that when the fall business opens there will be something of a scarcity of goods, and this fact will probably contribute to the strength of the market. Several of the manufacturers express the opinion that the price of Weights is likely to advance under the pressure of orders from the dealers, in view of the fact that factories may not be able to take care promptly of current business.

Soapstone Goods.—Pike Mfg. Company, Pike Station, N. H., and 151 Chambers street, New York, quote the following prices on Soapstone Griddles, subject to a discount of 33 1-3 per cent.:

Round Griddles.		Per dozen.
10 inches diameter.....	\$8.75	14 inches diameter.....\$16.75
12 " ".....	12.50	16 " ".....18.75
Oval Griddles.		Per dozen.
8 x 16 inch.....	\$13.00	11 x 22 inch.....\$22.50
9 x 18 ".....	15.00	12 x 24 ".....27.00
10 x 20 ".....	18.75	

Foot Warmers are sold from the following list, which is subject to a discount of 40 per cent.:

Foot Warmers.		Per dozen.	Per dozen.
4 x 6 inch.....		\$2.50	8 x 10 inch.....\$5.00
5 x 7 ".....		3.12	8 x 12 ".....5.62
6 x 8 ".....		3.75	10 x 12 ".....6.25
7 x 9 ".....		4.37	12 x 15 ".....7.50
7 x 10 ".....		4.75	

Fence Staples.—Some shading of prices on Fence Staples is reported, but the market on these goods, as a whole, is fairly strong and the demand active.

Block Tin Pipe.—The demand for Block Tin Pipe is referred to as very satisfactory this season. The price of this material, which has fluctuated to some extent with the changes in the price of the raw material, is now 37 cents per pound.

Wire Nails.—The store demand for small lots of Wire Nails continues in fair volume. Quotations remain unchanged on the basis of \$2.30 per keg for small lots, New York. The output of Wire Nails has been much reduced by the closing down of mills for the annual repairs and cleaning up.

Cut Nails.—The condition of the Cut Nail market is unchanged, except that mills are making shipments more promptly. The requirements at this point are moderate, and prices are without change. Small lots from store are quoted at \$2.30 per keg.

Window Glass.—There is nothing of interest in the local Glass market, which remains quiet. The Jobbers' Association quotation for Single and Double Strength Glass from store is 88 and 5 per cent. discount.

White Lead.—The White Lead in Oil which is now going into consumption is being drawn to a considerable extent from purchases made some time since. Some makers have fallen so far behind in their deliveries that they are asking the indulgence of their customers until they will be in position to fill orders promptly. Prices are firm and without change, White Lead in Oil in small lots being quoted at 6½ to 6¾ cents per pound.

Linseed Oil.—There is an absence of large demand for Linseed Oil, orders being confined to present consumptive requirements. The market continues firm in tone and unchanged as to prices. City Raw, in small lots, is quoted at 68 to 68½ cents per gallon.

Spirits Turpentine.—Quite a large quantity of Turpentine was taken by canners and varnish makers at the close of last week, after which the demand was light. Firm advices from the South during the first part of this week resulted in a stronger market at this point, with more ready buyers and a slight stiffening of prices. Turpentine in small lots from store is quoted at 47½ to 48 cents per gallon.

TRADE NOTES.

THE WHITTAKER & WEBER MFG. COMPANY, St. Louis, Mo., manufacturers of Tinware, Stamped Ware, &c., of all varieties, have introduced their goods in the foreign markets, and within the past few days have made a large shipment to Liverpool, England.

THE BAY STATE ALUMINUM COMPANY, Quincy, Mass., manufacturers of Aluminum Ware, Chafing Dishes, Kitchen Utensils and Specialties, &c., report that they are very busy and have more orders now on their books than they can fill in two months. The business of the concern has grown rapidly of late. Leon Ward, manager of the company, advises us that they are having a big run on their Individual Communion Services. The company's factory is equipped for doing all kinds of experimental work in Aluminum.

THE PALEN TIN FOIL factory of Kingston, N. Y., one of the largest concerns of the kind in the United States, has been purchased by the Republic Tin Foil Company, who propose to increase the capacity of the plant.

THE DETROIT COPPER & BRASS ROLLING MILLS state that they expect to erect and operate a Tube plant at Detroit.

THE JOHN DUNLAP COMPANY of Pittsburgh, manufacturers of Tinware, have commenced work on a new

plant at Carnegie, near Pittsburgh. There will be two main buildings of brick and steel construction, one measuring 70 x 250 feet and the other 40 x 250 feet.

THE BRASS foundry of the Charles Parker Company's plant, Meriden, Conn., was recently destroyed by fire. The loss will reach \$5000.

M. H. TREADWELL & Co., 95-97 Liberty street, New York, have recently moved their estimating department to their Lebanon, Pa., works, where they would be pleased to receive a full line of catalogues, illustrated circulars and price-lists relating to engineering, founding, or anything in the way of special machinery.

THE sympathy of *The Metal Worker* is extended to Charles Burton of *Stoves and Hardware*, St. Louis, whose father, Charles W. Burton, died at his home in Plainfield, N. J., on the 18th inst. The deceased had for many years been engaged in the wholesale grocery trade in New York, but for the past 15 years had been connected with the Tide Water Oil Company, New York. He would have been 80 years of age in September.

FOR SALE.

A valuable manufacturing property, situated at 23d and Smallman streets, Pittsburgh, Pa. Remarkably well located as to shipping facilities, consisting of new steel constructed building, 118 x 154 feet, thoroughly equipped with suitable machinery and tools for working in sheet metals. This establishment has a long ground lease, on very favorable terms, and a large trade that will naturally follow it. It is the only concern in the Pittsburgh district, with all machinery for making corrugated conductor pipe eavestrough, ridge roll, &c. This is an opportunity to secure a bargain for one desiring a business that can be operated at once. Any one caring to investigate, with object of buying the building, machinery, &c., or any practical party with capital caring to take an interest in the business, please address

H. L. IRWIN,

Receiver for Marlin & Co., Inc., Pittsburg, Pa.

For Sale.

An old established stove plant or controlling interest in same, employing 20 moulders, to some competent man who will take the management of same. Address "STOVE PLANT," care The Metal Worker, 1205 Chemical Bldg., St. Louis, Mo.

DOMESTIC ELECTRICAL WORK.

Concise and Practical Explanations for Plumbers, Tinnors and Hardware

Dealers on How to Wire Buildings for Bells, Alarms, Annunciators, and for Gas Lighting from Batteries.

Illustrated with Twenty-two Diagrams.

BY WILLIAM A. WITTBECKER.

Price, in Paper, 25 Cents. Price, in Cloth, 50 Cents.

The growing demand for simple electrical apparatus in dwelling houses, offices and workshops, and the need of plain instructions whereby any person without a previous knowledge of electricity may be enabled to undertake their successful installation, has prompted the publication of this little book. It is not intended for the amateur who seeks for nothing but experimental work, neither is it expected to enlighten the expert electrician; but to the person who is seeking for information that will assist him in increasing his daily earnings this little volume is addressed.

PHILADELPHIA**BERGER BROS. CO.****The New York Iron Roofing and Corrugating Co.**Finest and Largest Variety of
Sheet Metals. Products manufactured in the U.S.**FIRST & WASHINGTON STS.****JERSEY CITY, N.J.****POLYGON****CONDUCTOR PIPE.**

In presenting our Patent Polygon Sheetmetal Conductor Pipe, we feel confident that its merits are shown sufficiently in the cut to not require a long description.

The pipe is expansive. Through its peculiar polygon scalloped spiral construction, producing sufficient expansion and resistance, an artistic effect is also secured, not possessed by any other conductor pipe in the market.

Ice forming in it will not, by slipping, as in other conductors, burst joints and seams, but will descend gradually, without injury to the pipe. Water, in heavy rains, will discharge more freely, as the pipe will not choke.

Considering quality of material used and workmanship required in producing the pipe, also the durability and design obtained, the Patent Polygon is, besides being the best, the cheapest in the market.

Made in copper and galvanized iron. Write for catalogue and information free Address

THE BERGER MFG. CO. CANTON, O.

APPEARANCES COUNT.

Appearances count in selling horses or houses or almost anything you can mention. Metal Ceilings are no exception to the rule. No one is going to look as favorably upon a commonplace looking design as upon one that is artistic. Another reason why only artistic Metal Ceilings should be selected is their durability. Metal Ceilings go up to stay; hence, it is important that they be so artistic they will not get distasteful to the man who has to see them year after year. Harmonious ceilings and side walls in the established, historical, decorative styles are always appropriate and pleasing. Hence, no mistake will be made in choosing "Berger's Classik" Metal Ceilings.

BERGER'S *Classik* Metal Ceilings

Are the handsomest and most artistic upon the market

They are correct in style, attractive in design, and stamped with a clearness which brings out the detail in bold relief. They not only win the preference over others, but actually make sales for Metal Ceilings, where, otherwise, other materials would be used. Write for handsome Catalogue and full particulars. We mail them free upon application.

THAT can be shipped knocked down and takes fourth class freight rate. Made any size, with plain ends or with louvre ventilators in ends.

Guaranteed strong and storm proof. Can be set up by anybody without tools.

The New Metal Worker Pattern Book.

425 Pages. 744 Illustrations.
Size 10 x 13 inches.

A new treatise on pattern cutting as applied to all branches of sheet metal work.

Cloth Bound, Price \$5.

This work contains a collection of 218 problems and an elaborate explanation of the principles of pattern cutting, including Triangulation.

It embodies the problems of the former Metal Worker Pattern Book, all of which have been revised, and many of which have been entirely rewritten and solved by more approved methods. To these have been added 75 new problems and much other new material and explanatory matter, making this work a model of completeness in every respect.

ARRANGEMENT.

In point of arrangement the new work far surpasses the former one in that the problems are classified under three different heads, and simply indexed, and also that by means of a table of contents any required department of the work can be easily found.

CONTENTS.

While Chapter VI, comprising the greater part of the work, is devoted to the solution of problems, the five preceding chapters thoroughly explain the principles of pattern cutting, and place the student in possession of the preliminary information necessary to a thorough understanding of the subject.

SUMMARY OF CONTENTS.

- I. Terms and Definitions—15 pages.
- II. Drawing Instruments and Materials—13 pages.
- III. Linear Drawing—6 pages.
- IV. Geometrical Problems—35 pages.
- V. PRINCIPLES OF PATTERN CUTTING—25 pages.
- VI. PATTERN PROBLEMS (3 Sections)—325 pages.
 1. MITER CUTTING,
 2. FLARING WORK,
 3. TRIANGULATION.

All Tanners, Cornice Makers and Sheet Metal Workers should be provided with a copy of

The New Metal Worker Pattern Book.

Price \$5, post or expressage paid.

HAND SHEARS FOR SLITTING LONG SHEETS.

Niagara Hand Slitting Shears are distinguished from ordinary Tinnern's Shears through the peculiar shape and arrangement of the jaws and handles. The lower jaw is relieved to allow the material to pass by. Both of the handles remain above the work while cutting. A sheet of any length can be cut apart without trouble and injury to the hands of the operator.

Adapted to cutting apart long sheets, cutting corrugated sheets lengthwise, and handy in taking up and repairing metal roofing. Drop forged of best wrought iron and with steel-laid jaws, carefully tempered. Made by

CORNICE MAKERS' SQUARING SHEARS.
With Lever Arc, Automatic Gauge. Will cut No. 2 iron 97 inches long.

HERCULES SHEARS

make the cutting of sheet metal of heavy gauges an easy task for the mechanic and a profitable operation for the employer. With them a man can cut No. 12 steel with one hand on the lever, leaving the other hand free to guide the stock while cutting elbows, ties and circles, as small as 8 inch radius; this is done without burring or buckling either piece, thus avoiding hammering and straightening, which add to the cost of the product. They split sheets of any width or length up to No. 12 gauge, cut wire or bar-steel $\frac{1}{8}$ inch thick, cut off and mitre angle iron $\frac{1}{8}$ inch thick, and do it perfectly.

— WIGG: "I thought you told me you were in the iron business, and now you say you have started a laundry."

Wagg: "Well, that's an iron business, isn't it?"—*Philadelphia Record*.

— NO SYMPATHY THERE.—"I am going to marry your daughter, sir," said the positive young man to the father.

"Well, you don't need to come to me for sympathy," replied the father. "I have troubles of my own."—*Columbus (Ohio) State Journal*.

FURNACES

Should be constructed to give the maximum of comfort, with a minimum of expense. *Comfort* does not mean warm in one room and cold in another, but summer heat in all rooms in zero weather. Expense is not all in coal bills. Poor joints leak gas, light castings crack and burn out. Repairs in winter mean discomfort and sickness. The doctor's bill would have purchased a **Bay State Furnace** and saved all this. Be wise in time.

Moore's Ranges

THE PRIDE OF THE BRIDE—A new home completely furnished with every convenience is sure to have A MOORE'S STEEL RANGE in the kitchen. Not only the reputation of these ranges with previous users, but their neat attractiveness and handiness—which appeal to both the eye and the good sense of the buyer—insure this selection.

—The illustration is from a home recently furnished with Moore's Premium No. 268 Reservoir and Closet.

JOLIET STOVE WORKS, Joliet, Illinois,
HOLBROOK MERRILL & STETSON,
San Francisco, Sacramento, Los Angeles.

QUICK MEAL

Steel Ranges

HAVE EITHER A RIGHT-HAND RESERVOIR

OR A LEFT-HAND RESERVOIR

The Reservoirs used on the "Quick Meal" Steel Ranges are so arranged that they can be attached to the body of the Range without interfering in any way with either the draft or the baking of the Range. The pocket of the left-hand Reservoir projects through the left wall of the Range and fits flush with the inside of the left wall of the fire-box. The pockets of the right-hand Reservoir project through the right wall and a short way into the down flue of the Range. There are no dampers to confuse the operator or interfere with the draft of the Range. They have an outside casing, nicely japanned, which protects the Reservoir and prevents sweating.

The "Quick Meal" Reservoir is simple,
effective and attractive.

RINGEN STOVE CO. SAINT LOUIS.

A Popular name is a point of merit.

A 62-PAGE PAMPHLET

Comprising a Series of Articles and Letters on *Chimney Troubles and Their Remedies* published under the title

Contains a compilation from the columns of THE METAL WORKER, of articles and correspondence relating to house chimneys, defective flues, and kindred topics, comprising a source of information of the most practical and reliable nature, on overcoming difficulties which occur in the working of chimneys, flues, etc.

To all who are interested in flues and drafts, in their relation to stoves, furnaces and house heating apparatus, this book will prove instructive and helpful.

The Contents are as follows

POINTS ON CHIMNEYS . . . 7-32

An illustrated article by J. L. Blxby, Jr., describing many details in chimneys, which cause trouble, and giving remedies. An important table is presented, of the sizes of chimneys required in dwelling houses, based upon the amount of work to be done.

DEFECTIVE FLUES . . . 33-35

This article presents information resulting from a wide, practical experience of the writer, and gives sound advice on some of the details of chimney construction.

HOW TO IMPROVE A WEAK CHIMNEY . . . 36-40

VARIOUS FORMS OF VENTILATORS or CHIMNEY TOPS 41-45

CONDENSATION IN STOVE PIPES . . . 46, 47

SMOKE PIPE FOR WOOD FURNACES . . . 48

REMEDYING DOWN DRAFT IN CHIMNEY . . . 49-51

CONNECTED FLUES DESTROY DRAFT . . . 52-55

FAILS TO BAKE ON BOTTOM 56-62

40 good Illustrations help to make the Text clear.

"THE WINNER"Patented
DOWN-DRAFT**Oak Stove***A Fuel Saver.*Burns one-half less than
other Hot Blast Stoves.

FIRE POT at top of stove. Smoke pipe at base. Heat drawn to the floor. Fresh fuel being placed on top of fire, all gas and smoke are drawn through the fire to the base of the stove and consumed. Burns any kind of fuel and holds fire over night.

Has large ash drawer, which does away with dust and dirt in removing ashes.

Most economical stove on the market, as it utilizes more of the fuel than any other.

FIVE HUNDRED DEALERS

in the United States have sold **RIVAL** furnaces for the past fifteen years and are selling them now. They have allowed other dealers to put in the **CHEAP WORK** and have given their customers

RELIABLE FURNACES

wisely installed and thoroughly efficient in operation. Where **RIVAL** furnaces have been sold the general tone of a furnace business has been advanced to a higher level. Where they have not been sold the furnace business has been in disrepute. Dealers that have had an unsatisfactory business during the past year, have had

MUCH TROUBLE and LITTLE PROFIT

should consider that possibly it is owing to the character of the heaters they sell. We want good dealers to sell our furnaces, install them in a good manner, and good satisfaction will result with increased business at good profit. Our catalog illustrates and describes the line of heaters we make and on application we will quote right prices.

BOYNTON'S "RENOWN" PORTABLE FURNACE

A new and distinct type of construction thoroughly tried and tested. Possessing more area of heating surface to area of grate surface than any other furnace manufactured.

Notice construction of cast iron heating flues, each one directly over and in contact with fire. Can we mail you catalogue and prices?

The **BOYNTON FURNACE CO.,**
NEW YORK. CHICAGO.

IF YOU ARE NOT SELLING THE

Peck-Williamson Underfeed Furnace

you have not the trade and are not making the money you might. Just a pull or two of the lever feeds the new coal from underneath.

The Underfeed Furnace consumes less fuel than any other furnace ever built. The coal is burnt more slowly. All the heat units from it, as well as from the smoke, are utilized and all smoke eliminated.

Our handsome booklet explains its splendid heating qualities and coal saving.

You may have this booklet and our special plans for selling. Ask for booklet about our Laundry Dryer also.

310	31 "	62 "	52 "	135 00	17 00	7 50

The "DIGHTON OAK" is made especially for burning wood, but is as well suited for coal, coke or gas for fuel. The general type of construction is exactly the same as the regular "DIGHTON" which has become so well-known as a durable and economical heater. The outside measurements, flue construction and flue measurements are the same; the large double feed doors allow of taking in large chunks of wood or a 4-foot stick cut once. The wood grate is not fastened to the fire pot or coal grates; it rests upon the triangular grate bars, and by easily turning these bars the fire is thoroughly cleaned. If at any time it may be desirable to use coal instead of wood as fuel, this grate can be removed in a minute's time through the feed door and set aside until such time as you wish to change to burning wood again.

DIGHTON FURNACE CO., Taunton, Mass.

GILT EDGE

stands for best when applied to furnaces. The many dealers who have installed and the thousands of householders whose homes have been heated by our furnaces show they like the Gilt Edge, as will be seen by the testimonials they have written. Let us send you a few of them.

The Keystone Joint used in Gilt Edge Furnaces is the only permanent gas tight steel and cast iron joint on the market.

STOVE PIPE DAMPERS

Fine Nickel Plated Handle.

Sharp Pointed Spindle.

Manufactured by

KRAMER BROS., Dayton, Ohio.

Semi-Sectional View.

Every Practical Stove Dealer

knows that heat without circulation is valueless. The best circulator gives the best heat.

New Era Radiators have *perpendicular* tubes. They take the cool air in at the bottom and rapidly heat it in the natural way *as it ascends*. Their construction tends to *increase* circulation instead of *retard* it, as tubes in any other direction would. All the products of combustion are compelled to touch the outer or inner surface of the tubes and the maximum amount of heat is radiated and circulated throughout the room.

If you would sell the best Radiator, you must buy the best. "*New Eras*" are best in material, best in workmanship, best in appearance, and best in results. Made in three styles and many sizes. Prices are right, affording a large margin. Don't buy something cheap on which you make but little. People are willing to pay a fair price for a good article. Send for our inducements now and be prepared to talk *New Era Radiators* at the right time.

Index to Reading Matter.....Page 64

The South African Market.

The conclusion of the war in South Africa is being followed by the beginning of a reconstructive settlement of the districts most largely affected by the late conflict. According to the Johannesburg correspondent of the London *Times* this task is being taken in hand with all possible dispatch. All of the departments of State are working at full pressure, but the amount of work to be done is so enormous and the obstacles to be removed are so great that it will take a long time before any substantial results are likely to be seen. One of the great impediments toward a rapid reconstruction in the devastated regions is the difficulty of transporting goods from the coast. The *Times* correspondent says that not only is there about twenty years' arrears of work to be caught up with, but the destruction caused by the war during the last three years has also to be made good. Hospitals, asylums and jails are waiting to be built or to be provided with increased accommodations. There are also a large number of public buildings to be erected, while some of the towns in the Transvaal colony have practically to be rebuilt. In addition, thousands of private dwellings, stores and buildings of all kinds have to be repaired or erected. The material needed for all these purposes would, at the present rate, take years to transport from the coast, and until a large addition to the rolling stock of the railroads is secured comparatively little reconstruction work can be accomplished. Undoubtedly, however, the necessary enlargement of transportation facilities will be provided as quickly as possible. The South African market will offer an immense field for the sale of goods of all kinds which go into buildings, as well as household goods, agricultural implements, and in fact everything required or used by a civilized community. It is reasonable to suppose that a considerable volume of South African business will come to the United States, provided the shipping facilities and the arrangements for marketing the goods in that country are properly attended to by our manufacturers and exporters. All Europe is looking to South Africa as offering one of the most favorable opportunities ever provided for the marketing of their surplus goods. The complete reconstruction of the devastated country, it is said, will take fully ten years. With the developments naturally to be looked for under the new régime there will be a call for a vast amount of manufactured goods of all kinds. There is no reason why the United States should not secure its full share of the trade.

Enlarging a Retail Business.

The successful retail merchant, like the successful manufacturer, is constantly endeavoring to enlarge his business. He must see his trade increasing. He realizes that much of his business is each year being done on a closer margin, and as the percentage of profits decreases the volume of trade must be increased. These are self evident facts, and the question of how to increase his trade without materially adding to the fixed charges of his business is one of prime importance. There are a number of lines of goods that can well be sold in the retail stove and hardware store and added to the regular stock without necessitating a larger selling force or materially increasing the expenses of the store. Trade can be worked up on such goods in the dull season. With the expense of perhaps one or two additional employees the retail business can be enlarged by adding new lines of goods. An increased trade and an enlarged field might be readily found by the retailer in taking up some kindred lines which are not now to be found in all stove, hardware and house furnishing goods stores. Among these lines may be mentioned paints, varnishes and painters' supplies, fishing tackle, athletic goods, hammocks, photo goods, electrical goods, such as door bells, batteries, &c.; belting, small tools and silver ware, composing plated knives and forks and silver novelties. Many retailers, too, have with very satisfactory results taken up other lines, such as harness, sewing machines and agricultural implements. In this matter it is obviously necessary that good judgment be used in deciding on the advisability of thus enlarging the scope of the business, and that at the same time skill and energy be put forth in making and establishing a market for the new lines. The benefit which the whole business would naturally derive from this infusion of enterprise and effort is another argument for thus broadening the field.

Read Your Trade Paper.

One sometimes hears a tradesman say that he has no time to read his trade paper; the details of his business absorb so much of his energy, that, after his day's work is ended, he has none left to spend upon the perusal of anything beyond the daily newspaper. If the case of a man of this kind is investigated it will usually be found that he is giving up a large share of his time and attention to the petty details of his business, work which might easily be performed for him by a clerk. This is a short sighted policy. It is the progressive, up to date business man who will tell you that the time he devotes to reading his trade paper and trade literature generally is one of his best investments. As well could the professional or scientific man expect to make a success in his line without keeping himself abreast of the developments in his field of work, as presented in the special organs of his profession, as can the tradesman afford to ignore the trade news and the helpful ideas as to new methods, new goods and new developments in his field that are presented in his trade journal. The trade paper should be read carefully each week, in order to obtain from it all the benefit possible. The wise tradesman, moreover, will not only read his trade paper

himself, but will pass it on to such of his employees as he believes would be interested in and helped by it. It is the only method whereby a wide acquaintance with what is going on throughout the country in his line of business can be secured by any tradesman. The trade press, as a class, is loyally working for the good of its clientage, and it is entitled to their support and active encouragement. Therefore, we say to every tradesman, do not neglect to read your trade paper regularly and fully, even if you have to make a sacrifice of an hour or so of recreation each week to do so.

Editorial Notes.

It is a matter of regret that the current high prices in so many lines of goods and the absorption of manufacturers' energies in the execution of orders for the home market are interfering seriously with the regular supply of goods called for by foreign buyers. Houses in the export trade refer to this fact as operating to materially diminish the volume of business which might otherwise be done, but the ease with which American goods find foreign sale furnishes something of a compensation, as increased varieties are going abroad. The next decline in prices of manufactured products is awaited by those cultivating foreign business with anticipations of the great opportunity which will be afforded for entering more aggressively and successfully than ever before into the markets of the world.

The very substantial basis on which the iron trade of the country rests is shown by the heavy transactions in pig iron for delivery next year. The buying movement is general, all markets reporting an active demand, which comes from all classes of consumers. The disposition to provide for requirements so far in the future is largely prompted by the present scarcity of iron and the belief that no great improvement will be experienced for some considerable time. The coal miners' strikes in Pennsylvania and the Virginias drag along with little prospect of an early settlement and the supply of pig iron is thus still curtailed for lack of fuel. Consumers who must have iron are compelled to pay such premiums for early delivery that the prices named for next year are attractive, even though much higher than those paid on contracts running through this year.

THE BUSINESS OUTLOOK.

At the end of July the summer has so far advanced that the outcome of the crops can be conjectured with a reasonable degree of certainty. The winter wheat harvest is over, the oats harvest is progressing and the spring wheat, corn, cotton and other fall crops are so far along that little can happen after this time to injure them seriously. It is, therefore, fairly safe to begin to take an account of stock and see how the country stands with regard to its agricultural interests, which are the foundation of all prosperity. It is now the belief of those who should be well informed on these subjects that the United States will this year enjoy a heavy crop of wheat, running well above the average; a bountiful yield of oats, comparing favorably with past good seasons; a "bumper" crop of corn, which may far surpass anything before experienced; a large production of cotton, perhaps above the average, and a sufficient yield of other agricultural products to rejoice the hearts of those who make a specialty of them. The drought in the Southwest early in the year and the excessive rains in numerous sections through the spring and summer wrought injury in some localities and caused heavy losses, especially in the flooded areas, but the general

condition of the country was so very favorable for growing crops that the grand result up to this time has not been seriously affected.

The basis for another year's good business thus seems to be established. The railroads which serve the agricultural sections are already counting on a heavy fall and winter traffic and are making their preparations accordingly. The managers of these lines as well as of those not directly dependent on farming interests are no longer cautious in their prognostications of the future, but speak in the most sanguine terms of the great volume of business which they expect to handle. They are embarking in schemes for the betterment of their facilities with confidence in their ability to earn the money to pay for them. This confidence has been stimulated by the remarkable ease with which the country endured the heavy reduction in last year's fall crops. Although the loss was so great that for a time a serious backset to business was apprehended, yet the momentum of the previous prosperous years was sufficient not only to carry us safely over to another crop season, but even to swell the demand for manufactured products to unprecedented proportions. This is strikingly shown in the statistics just published by the American Iron and Steel Association, which give the marvelous total of 17,012,315 gross tons of pig iron produced in this country in the 12 months extending from July 1, 1901, to July 1, 1902, which was much in excess of any previous 12 months, although covering the precise period of crop failure and loss of trade on that account. Not only was this vast production required by the wants of the country, as shown by the stocks of less than 30,000 tons in makers' hands unsold on July 1, but a considerable quantity was imported besides. In other branches of the iron and steel trades and in other lines of productive industry similar results are shown. Surely after such an experience the managers of railroad interests are warranted in entertaining bright hopes for the future when the country is blessed by superabundant crops.

But is a continuance of the heavy demand for manufactured products to be expected? Has not the country supplied its wants to such an extent that a decline in trade should soon be experienced? Will bountiful crops insure the prosperity of manufacturing interests indefinitely? These are questions which present themselves to every manufacturer and merchant when he gets time to reflect upon the situation. If conditions were in any way analogous to those of any past period in the experience of the country, these questions could be answered very easily. The answer would be that the demand was not likely to last long, that the country was getting well stocked with merchandise and that big crops by no means always assured big business. But conditions have greatly changed in the past five years, and the experience of former times is not an infallible guide. Those who relied on their judgment as acquired by that experience, and have been looking for a collapse in prices since the culmination of the boom of 1900, have paid dearly for their lack of faith in the stability of the market. The great growth of the country in population, the wonderful prosperity of Western farmers, the huge foreign demand for all classes of American products, the comparatively light imports for a long series of years, the advance of the United States to a commanding position in the world of finance, the organization of colossal industrial corporations—all these and more have had their effect in increasing the business of this country and expanding it to dimensions beyond the expectation of the wildest dreamer. As far as can now be observed no unfavorable indications appear. The coal miners' strikes in Pennsylvania and the Virginias cannot last much longer, and when they are settled the effect on general business will be decidedly beneficial. Conservative business men look with some apprehension on the pyrotechnical display in Wall Street, but even that can be read as one of the manifestations of faith in the future, as Wall Street is quite a reliable barometer as to business prospects. With all external conditions favorable, the future of the iron trade appears to depend largely upon itself, being a question of supply and demand. Productive capacity, therefore, should not grow too rapidly.

—*The Iron Age.*

THE MICHIGAN STOVE COMPANY'S HISTORICAL SITE.

A notable historical event was commemorated at Detroit on Thursday of this week by the unveiling of a bronze tablet to mark the spot on the grounds of the Michigan Stove Company upon which formerly stood the Pontiac tree, around which occurred the battle of Bloody Run on July 31, 1763. An interesting programme was arranged for this occasion, which was printed with a view to making it of value as a souvenir, comprising a four-page booklet, artistically designed and presenting a photogravure of the tablet, as shown in the accompanying illustration.

The exercises were under the direction of the Society of Colonial Wars in the State of Michigan, and were participated in by the Michigan Society of the Sons of the American Revolution as invited guests. The programme was as follows, Hon. Thomas W. Palmer, ex-

The Lindemann & Hoverson Catalogue.

The 1902 catalogue of the A. J. Lindemann & Hoverson Company, Milwaukee, Wis., which has just been issued, consists of 196 pages, bound in a stiff purple colored paper cover, with a design in green and the address of the house in gold. The first section of the work is devoted to steel cooks and steel ranges, under the names of Popular, Gem, Ruby, Marvel, Garnet, Sunbeam and L. & H. Crown. The Popular range is made to stand on feet and is provided with reservoir. The Gem is a range of similar construction, with a steel base, while the other ranges are of a more pretentious character, having warming shelves, high closets, reservoirs and water backs. Some of large size are adapted for hotel use. They are also provided with a gas cooking attachment. The next 32 pages are devoted to the company's cast iron wood cooks and ranges, which are made in a variety of styles and designs, with end ash pit,

Bronze Tablet Erected on the Michigan Stove Company's Grounds.

president of the Society of the Sons of the American Revolution, presiding:

1. Unveiling of the tablet, by Theodore H. Eaton, Governor of the Society of Colonial Wars in the State of Michigan.
2. Presentation of tablet, by Hon. George H. Barbour, vice-president the Michigan Stove Company.
3. Acceptance of tablet in the name of the people, by Hon. Wm. C. Maybury, Mayor of Detroit.
4. Brief historic address, by Prof. A. H. Griffith of the Detroit Museum of Art.
5. Singing of "America" by the audience.

The tablet is one of the finest ever erected in Detroit. It was designed by E. T. Schoonmaker of New York and modeled and cast by the American Bronze Foundry Company of Chicago. The work of the modeler is highly complimented by Mr. Schoonmaker, who, in a letter to Mr. Barbour after the receipt of a photograph of the tablet, said: "The man who did this work is an artist. His treatment shows knowledge of his business, and I am glad you have been so fortunate as to have it placed in such good hands."

The location of the tablet is on a brick wall which runs along the company's premises on Jefferson avenue from the main building to the new building just erected. Between the two buildings stands the big Garland stove which was exhibited at the Chicago World's Fair and the center of this stove is exactly where the old Pontiac tree stood. The tablet is placed on the wall immediately in front of the big stove.

high shelves, hot closets, reservoirs and all the modern labor saving devices and conveniences. The following portion of the catalogue is occupied by oval air tight heaters for coal or wood, which are succeeded by the Meteor and Comfort radiators for attaching to the smoke pipes of heating and cooking apparatus for heating an upper room.

Soft coal heaters and oak stoves are then considered, and are followed by handsome square nickel trimmed parlor heaters, globe stoves, laundry stoves and farmers' boilers. Another section of the book is devoted to gasoline stoves of both high and low junior types, and a variety of wickless blue flame oil stoves for cooking and heating. Gas hot plates are shown and the New Century incandescent vapor lamps for lighting foundries and factories, also for chandeliers for lighting stores and in the form of students' lamps for reading. In the closing pages of the catalogue are shown lamp oil stoves, roasters, dripping pans, stove pipe, elbows, stove polish, pipe dampers and other supplies. The heating and ventilating goods presented in the catalogue consist of coal and special wood hot air furnaces, and round horizontal sectional steam and hot water heaters, tank heaters, laundry heaters and radiators.

THE LINCOLN STOVE COMPANY, Toledo, Ohio, have broken ground for an addition which will more than double their capacity.

Red Cross Stove Catalogue.

The thirty-sixth annual catalogue of the Co-operative Foundry Company, Rochester, N. Y., for 1902 and 1903 has reached us. It consists of 138 pages and is bound in stiff covers, showing on the front in red and black a cupola with the molders gathered, with their ladles, to get iron to pour off. In the first pages are presented views of the company's foundry, offices and warehouses in Rochester and in Lincoln Park. The introduction states that the concern do not hesitate to claim that "once a customer, always a customer," applies forcibly to the patrons of the Red Cross productions. The place of honor in the catalogue is given to the Red Cross Victor, followed by the Red Cross Princess, which are steel ranges of the most modern type, so constructed that the fire box equipment can be readily removed or replaced. They are provided with ash pans, warming shelves, high hot closets, reservoirs, drop oven doors and tea shelves. The top is provided with a plunge damper, and the pipe with a combination wheel register and damper. The broiling door is large and the oven door has a thermometer. One of the features of the range is the use of a cast iron base section for the extreme bottom of the range, contributing to ease in setting and to the cleanliness of the kitchen. Several pages are devoted to the Imperial Red Cross, which is a high grade square cast range of the portable type and of sheet flue construction, with high shelves, hot closets, reservoirs, ash pans and draw out oven shelves. The fire box equipment, whether duplex or dock ash grate, can be readily removed or replaced. The Red Cross Monarch is a range of different design but of similar equipment and excellence. The Peerless Red Cross and the Colonial Red Cross ranges are less pretentious goods, and the Right Red Cross is a range having a fire box on the right hand end. The Regal Red Cross is the leader of the square ranges, having four cooking holes on the top and provided with all the modern conveniences. This is followed by the Red Cross Pilot, Red Cross Dexter, Rival Red Cross, Red Cross Emblem and Red Cross Talsman. A three-burner gas cooking attachment, with oven and broiler, is also shown, with instructions for attachment and use. The company also make a variety of flat top cooking stoves with deep ash pit, end shelves, with pouch feed for soft coal and broiler doors for hard coal, and with reservoirs and wood grates. The Ideal Red Cross heads this line, followed by the Red Cross Hero, the Red Cross Challenge, the Red Cross Laurel, the Red Cross Champion and the Red Cross Mascot.

The parlor and heating stoves are headed by the Royal Red Cross, a high grade square parlor stove, not only of elegant appearance with handsome nickel trimmings and equipment, but also having features of exceptional merit in its construction. The Red Cross Bee, the Red Cross Garnet and the Red Cross Sunbeam are other modern square parlor heaters, the latter being adapted for heating a room above. The Red Cross Echo and Red Cross Carbon are followed by the Red Cross Oak, which is made in a variety of sizes and styles adapted for the use of either coal or wood. The Red Cross Star is a handsome gas heater, with a large illuminating front, for natural or artificial gas. The Black Prince and Gem are cast iron heaters of the globe stove type. A variety of laundry and tailors' stoves are another line. The Red Cross Triumph and Sylvan Red Cross are full nickel trimmed cottage parlor wood stoves, designed to burn wood from 22 to 26 inches in length, one with a double heater attachment and the other with a siphon flue. These are followed by the Crystal, Sunflower, box stoves, and the Warwick, an oval stove with sheet iron sides. The Bermuda is a hot air furnace put out by the company, having a large combustion chamber supporting a large indirect draft radiator. The Ajax furnace is of the return flue steel radiator type. The goods shown close with farmers' boilers and caldron kettles having a capacity of from 15 to 90 gallons. The last pages are devoted to directions for setting and operating stoves, which can be read with advantage at the beginning of the stove season, in order to avoid some of the troubles that come

from improper construction and location. The catalogue contains a code index and an index of the goods presented.

The Iron City Gas Stove.

Among the new goods which have been prepared for the season of 1902-1903 by the H. Adler Company, Pittsburgh, Pa., is the improved design embodied in the new Iron City gas stove, of which an excellent idea will be gained from the accompanying illustration. The body portion of this stove being made of one piece of sheet steel renders it unusually strong, while its appearance is neat and attractive. Another feature to which the manufacturers call especial attention is the slotted base in

The Iron City Gas Stove.

which the fender rests. These stoves are designed for use with natural gas as a fuel. They are finished in planished iron, brass, nickel and oxidized copper.

Gas Stoves and Stove Trimmings.

The Fanucr Mfg. Company, Cleveland, Ohio, have issued a 56-page catalogue devoted to an extensive line of hardware specialties, many of which are well adapted to the stove trade and those who handle house furnishing goods. The first articles shown are the Ever Ready and Star coffee mills, followed by toilet paper holders, handles for Mrs. Pott's sad irons, family ice tongs and ice picks and a quilting frame clamp. Another section is occupied by gas hot plates, four different one-burner apparatuses being shown, with the Rival, made with two and three burners. The Arctic stove trimmings consist of short and long handled coal shovels, pokers and slicers, with hook or straight point, and provided with spiral wire cool handles, and a variety of styles of cover lifters of the cool handle spiral wire style. A number of cast iron cover lifters are also shown with hollow handles and perforated to prevent their becoming overheated, together with carpenters', shoemakers', upholsterers' and tack hammers. Arctic spiders, sad iron stands and stove rests are followed by stove scrapers and an extensive line of flat and round head stove bolts, and a complete line of hot air registers and Arctic stove pipe dampers. The last pages of the catalogue are devoted to a number of different styles of toy stoves and ranges, toy pistols and advertising novelties.

THE WYANDOTTE STOVE COMPANY of Topeka, Kan., have been incorporated with a capital stock of \$20,000.

The Michigan Manufacturers' Association.

George H. Barbour, vice-president and general manager of the Michigan Stove Company, has been elected president of the Michigan Manufacturers' Association, whose headquarters are at Lansing, Mich. J. O. Beecraft, cashier of the Estate of P. D. Beckwith, Dowagiac, has been elected first vice-president, and another stove manufacturer, A. O. Bement of Lansing, has been elected treasurer. J. J. Hanshue is secretary. The association has been formed for the purpose of cultivating acquaintance and a friendly relation among manufacturers, of facilitating the interchange of ideas for mutual benefit and of promoting by concerted action the prosperity of the manufacturing interests. It proposes to look after important problems that are continually appearing—as, for example, transportation, discriminations, secret rate cutting, low rates on like products shipped by manufacturers in other States to territory where Michigan products should go, demurrage, car service, taxation, &c.

Economy Stoves and Ranges.

The Comstock-Castle Company, Quincy, Ill., are now sending out their fifty-fourth annual catalogue and price-list of stoves, ranges and hollow ware. It is a publication of 126 pages, 8 x 5 inches in size, inclosed in a light brown cover with dark brown lettering and the Economy trade-mark of the company in green on the front cover. In a note of introduction the manufacturers call attention to several additions that they have made this season to their previously large and well assorted line. Besides some new coal and wood cook stoves and ranges, they have added a handsome line of steel ranges and steel cook stoves and have also made some improvements in their Todd stoves. The opening pages of the catalogue are devoted to the Art Economy and I. X. L. Economy steel ranges, made with four and six holes and for hard or soft coal or wood. These ranges are said to be formed of the very best materials by skilled workmen and to embody every desirable feature of modern construction. The bodies are made of two thicknesses of cold rolled steel, interlined with asbestos board and tightly hand riveted. The outer casings of the bodies are made of the best grade of Wellsville polished steel. The ovens are of extra heavy wrought steel, strongly braced so as to prevent warping or buckling. Among their other advantages are well proportioned fire boxes, combination duplex coal and wood grate, large swing flue doors, flush encased reservoirs, furnished with cast enameled tanks; high shelves and closets of sheet steel, nickel plated steel swinging ash pan door and all the other usual equipments of a modern steel range. The King Economy steel range is a new construction, brought out this season to meet the demand for a line of cheap steel ranges, with pouch feed. A still cheaper steel range, under the name of Clipper Economy, is offered without pouch feed. These ranges are made with four and six holes, for use with soft or hard coal, or wood, and are offered with or without reservoir and low closet. Among the other goods in this line are the Triumph Economy, Derby Economy and Star Economy steel ranges, and the Cozy Economy, Boom Economy and Key-note Economy steel cooks.

The company's line of cast ranges and cooking stoves occupy 50 pages of the catalogue. These include the Queen Economy, Deane, Moro, Lusto, Mignon, Santee, Dearborn and Cute ranges, for coal. These ranges are handsome in design, are provided with the usual features and are up to date in every respect. The Queen Economy range, for wood, and the Home Eureka, Test, Vigil, Myrtle, Medallion, Insignia and Rustler, for coal, complete the list of cast ranges. On the 12 following pages are illustrated and described the company's line of wood cooks. Among these special attention is called to the True Economy and Nectar, which constitute an entirely new square oven line recently brought out. These ranges are handsomely ornamented and mounted and are provided with extension top shelf, heavy covers and centers; draw out hearth slide, nickel stand and towel

rod, high and broad oven, large and deep fire box, lined oven doors and encased enameled flush top reservoir.

The heating stoves include the Economy, a wood base burner, all cast iron Todd stove, of new and original pattern, and a new line of air tight. These latter embrace the Economy Hot Blast, the American Hot Blast and the Dresden, for coal, and the Scorcher, Orbit, Harp, Joy and Special air tight, for wood. All these stoves are provided with the company's antireosote pipe collar, which rests small end down upon an inside flange. These heaters present an attractive appearance, being tastefully decorated with a judicious application of nickel trimming. The Oak stoves shown embody the very latest form of construction with all the modern desirable features. Among these are the Prize Oak, Junior Oak and Saxon Oak. The concluding pages are devoted to ground and unground hollow ware, including pots, skillets, kettles, griddles, tea kettles, ham broilers, gridirons, waffle irons, sugar kettles and Dutch ovens; also a variety of miscellaneous stove supplies.

The Gem Stove Caster.

Herewith is presented an illustration of the Gem ball bearing stove caster made by Kramer Brothers, proprietors of the Dayton Stove Repair Works, Dayton,

The Gem Stove Caster.

Ohio. Among the special points made by the manufacturers in connection with these casters are that they are made of solid cast iron and that they are so constructed that one man can place the caster under a stove, while the ball bearings make it run easily. The casters are furnished four to a set.

The Monarch Hub Range.

Those who cater to the building trade will be interested in the new Monarch Hub range, manufactured by the Smith & Anthony Company, 48-54 Union street, Boston, Mass. This range is made with 7, 8 and 9 inch covers, with 20 and 22 inch square ovens, that are thoroughly heated on five sides by means of an improved arrangement of sheet flues. The fire chamber is equipped with dock ash, reflex or plain grates, either of which may be readily removed without disturbing the fire brick. A large ash pan is also provided. It has a French interchangeable square sectional top provided with heavy nonwarping covers. The nickel parts can be readily removed without touching a bolt, which is very convenient for cleaning or blacking the range. It is made with a back rack, high shelf and hot closet. All of the ranges are provided with a low closet. The range is also made as a combination gas range, the gas attachment connecting at the oven end, having three surface burners on top, a 14 x 18 x 11 inch baking oven, and a 7-inch high broiling oven of the same size. This range is the subject of a special circular printed in two colors and illustrated with half-tone engravings. Four pages are devoted to cuts, and the other four to enumerating its many excellent features. Among the illustrations is a picture of a chariot race, in connection with which attention is called to the fact that "one more heat" has been added to the former good record of the "big four," which now becomes the "big five," by the addition of the Monarch Hub to the Beauty Hub, Magic Hub, Royal Hub and Model Hub, which are characterized respectively as "good, very good, better, best and perfection." This circular cannot fail to attract attention to the enterprise of the house and the excellence of their constructions.

THE SUFFOLK STOVE COMPANY, Suffolk, Va., are erecting an addition to their foundry.

Adjusting Stove Plate Prices.

No more interesting theme could be chosen for the discussion of the stove plate molder than that which deals with the methods of setting prices on work. It is one which affects his ability to make decent wages and calls for eternal vigilance on his part in order that his skill may receive a just and equitable reward. It cannot be said there is absolute uniformity in methods. Nearly every district has some features of similarity and others of wide difference. The subject in Eastern Pennsylvania has recently excited considerable discussion, says a writer in the *Iron Molders' Journal*, and before I illustrate a system in common use and another which some of us think is more equitable I will take the liberty of suggesting that stove platers who have had experience in other districts could advance the interests of our branch of the craft by taking up the discussion and explaining the methods followed by them, or those which have appealed to them as being the fairest and most systematic.

I will first deal with a system which is in considerable vogue, but which, nevertheless, I deem to have many unfair features, and call it Rule No. 1.

Rule No. 1.—Briefly stated, this rule premises that, having set the molding price of a piece of work belonging to a certain size of stove, the price of the same piece on all other sizes can be set by adding to or subtracting from that price $\frac{1}{2}$ cent for every inch of difference in length, breadth and depth according as the piece is larger or smaller than the original one.

Let me illustrate this by a few examples: We have a No. 6, No. 7 and No. 8 range bottom.

The No. 7 is 32 inches long and 25 inches wide, and the price has been set at 30 cents.

The size of the No. 8 is 35 inches long and 27 inches wide. Applying Rule No. 1, this bottom being 3 inches longer and 2 inches wider than the No. 7, its price would be $30 + 1\frac{1}{2} + 1 = 32\frac{1}{2}$ cents.

No. 6 is 29 inches long and 23 inches wide, so that its price by the same rule would be $30 - (1\frac{1}{2} + 1) = 27\frac{1}{2}$ cents.

In each of these cases it is presumed that the depth is the same.

Let us now take No. 14, No. 16 and No. 18 parlor heater bottoms, where the depth also would vary.

The No. 16 is 22 inches long, 19 inches wide and 4 inches deep, and the price 24 cents.

The No. 18 is 24 inches long, 21 inches wide and 5 inches deep; or 2 inches longer, 2 inches wider and 1 inch deeper. Its price by Rule No. 1 would therefore be $24 + 1 + 1 + \frac{1}{2} = 26\frac{1}{2}$ cents.

The No. 14 being 19 $\frac{3}{4}$ inches long, 17 $\frac{1}{4}$ inches wide and 3 inches deep, its price would be $24 - (1\frac{1}{8} + \frac{7}{8} + \frac{1}{2}) = 21\frac{1}{2}$ cents.

I will now describe a method which appeals to me as being more equitable, and illustrate its operation by working out the same examples. I will call it Rule No. 2.

Rule No. 2.—The molding price of a certain piece of work having been set, the price of the same piece of all other sizes of the stove would be as the ratio of its area or volume to that of the one set—that is, the area (or volume when the depth differs) of the smaller is to the area of the larger as the price of the smaller to the price of the larger.

Taking the first example—range bottoms, we find that the depth of flask required is practically the same in the several sizes, so that in computing what should be their relative prices it is not necessary to give the depth consideration, which can be done without altering the result.

To apply Rule No. 2 it is first necessary to determine the area of each bottom, which is done by multiplying the length by the breadth. Thus:

No. 6— $29 \times 23 = 667$ square inches = area.

No. 7— $32 \times 25 = 800$ square inches = area.

No. 8— $35 \times 27 = 945$ square inches = area.

The price of No. 7 has already been set at 30 cents—that is, a bottom containing 800 square inches is made for 30 cents, and dividing 800 by 30 we find, so to speak, that 26 2-3 inches of surface is molded for 1 cent. That being the case, then for every 26 2-3 inches contained in the bottoms of the other sizes 1 cent should be paid.

Let us see how this would work out:

No. 6 contains 667 square inches, its price would therefore be $667 \div 26 \frac{2}{3} = 25 \frac{1}{3}$ or 25.01 cents.

No. 8 contains 945 square inches, its price would therefore be $945 \div 26 \frac{2}{3} = 35 \frac{7}{16}$ or 35.43 cents.

In the case of the parlor heater bottoms depth is a varying quantity and instead of taking the measurements of the pattern itself, I would suggest that we determine prices by the size of flask required.

No. 16, whose price has been set at 24 cents, measures $22 \times 19 \times 4$. Allowing an inch of sand margin it would require a flask about $24 \times 21 \times 11$.

Placing the depth of the flask of No. 16 at 11 inches, that of No. 14 would be 10 inches and No. 18 12 inches. This includes cope and nowel.

To compute the volume of these flasks for purposes of comparison we multiply their length, breadth and depth together and the result will represent the volume in cubic inches. Thus:

No. 14— $24\frac{3}{4} \times 19\frac{1}{4} \times 10 = 4186.875$ cubic inches = volume of flask.

No. 16— $24 \times 21 \times 11 = 5544$ cubic inches = volume of flask.

No. 18— $26 \times 23 \times 12 = 7176$ cubic inches = volume of flask.

The price of No. 16 having been set at 24 cents, we find that a bottom whose flask contains 5544 cubic inches pays 24 cents. To determine what the No. 14 with a flask containing 4186.875 cubic inches would pay we proceed as follows:

A flask containing 5544 cubic inches pays 24 cents.

A flask containing 1 cubic inch pays $24 \div 5544$ cents.

A flask containing 4186.876 cubic inches pays $24 \div 5544 \times 4186.875 = 18.125$ cents.

By the same process it would be determined that the No. 18 would pay 31.06 cents.

Let us now recapitulate the prices of these two series under Rules No. 1 and No. 2.

Range bottom.	Price by rule No. 1.	Price by rule No. 2.
No. 6.....	27 $\frac{1}{2}$	25.01
No. 7.....	30	30
No. 8.....	32 $\frac{1}{2}$	35.43
Parlor heater bottom.	Price by rule No. 1.	Price by rule No. 2.
No. 14.....	21 $\frac{1}{2}$	18.125
No. 16.....	24	24
No. 18.....	26 $\frac{1}{2}$	31.06

Thus it will be seen that the prices of the smaller sizes under Rule No. 1 are in each case better than they would be under Rule No. 2, but the prices of the larger sizes just the reverse. Foundrymen may contend that Rule No. 1 is therefore just as fair on the whole as Rule No. 2. If there were always an odd number of sizes and the prices were first settled on the middle one, it might seem somewhat fair; but, in my opinion, it is not fair even then, as the men making the larger sizes will have a much poorer job than the men making the smaller sizes. But that is not the worst feature where Rule No. 1 is in operation. Foundrymen are shrewd and quick to take advantage of a situation; they therefore insist on pricing the smallest size first and in this way get considerably the best of the deal.

I don't know that this subject has ever been discussed in the *Journal* before, but it is a most interesting one to the stove plate molder, and a full understanding and interchange of views upon it will be of incalculable benefit. I have simply treated upon the subject of pricing other sizes from the price of one that has been set, but the whole subject of pricing is an important one and worthy of discussion. I realize that in pricing the first stove of any line good judgment and comparison with similar stoves must necessarily enter into the determination of its price. Difficulty of molding will necessarily influence one's judgment, and it is not to be expected that a set formula could be devised which would enable us to set a price on any piece of work by simple figuring, but there are important points that might with profit be made more uniform.

The New Jewel Steel Ranges.

The George M. Clark & Co. Division of the American Stove Company, Chicago, have made a new departure and are now bringing out a line of steel ranges designed for the use of coal and wood. They have issued a handsome catalogue of 16 pages, giving a description of the line and illustrating the special features. George M. Clark & Co. have hitherto devoted their attention to the manufacture of gas and gasoline stoves, but have for several years been studying the subject of the construction of coal and wood ranges, and believe that the line which they have brought out will meet with the approval of the stove trade. They have, of course, had a long experience in sheet metal construction in getting up their gas and gasoline stoves, and this experience has enabled them to get out a line of steel ranges which not only present an attractive appearance but also embody all strictly modern features.

The bodies of these ranges are made with triple walls. The outside wall is of heavy polished steel, the inside of heavy cold rolled steel, and between them is placed thick asbestos board. Where the heat is most intense the asbestos is from $\frac{1}{2}$ to $\frac{3}{4}$ inch thick. The sides are locked into square polished steel corner posts,

thus doing away with rivets and bolts. This makes a very strong construction, easy to take apart if necessary, but securing tight joints without cement or putty. The oven is made of one piece of heavy steel, which runs from the middle of the bottom, around overhead and back to the middle and there is double flanged, making it perfectly rigid. The oven door has no joints, being drawn from one heavy piece of steel. Two braces support the door when open, thus making it a strong stiff shelf. This door is heavily nicked and has the word "Jewel" in medallion form in the middle. The top of the range is made of very heavy steel, drawn down under great pressure, which makes a smooth, true, rigid, unbreakable and perfectly fitting top. The anchor plates in which the covers rest are supported by the range body, but not fastened to it, and are therefore free to expand and contract without producing the slightest strain on any part of the range. Duplex grates are used unless otherwise specified. By reversing this grate it can be used either for coal or wood and can be taken out of the range without disturbing the linings or water front. These ranges are furnished with an extension to the fire box for wood when ordered. Water fronts, pouch feed and reservoirs are also furnished when ordered. The reservoirs are made either left or right hand. The left hand reservoir has a cast iron galvanized iron pocket attached which projects through the left end of the range and the fire box lining. The right hand reservoir has two 9-inch copper pockets which project from the side of the reservoir and through the right wall of the range. Both are said to heat water quickly. These reservoirs can be removed for cleaning or permanently detached at any time. The Jewel steel ranges are made in nine sizes and styles and are furnished either in square form, or with high shelf or high closet.

ODD PLATES.

THE SIMPSON Gas Ranges, Hot Plates, Ovens and Cookers form the subject matter of a rather striking circular that is being distributed through the mails by the Simpson Stove & Mfg. Company, Pittsburgh, Pa. The circular is a folder printed on sage green paper in black and yellow, and the burden of its message is suggested in a picture of a man with a lantern, whose search for "the best" in gas cooking goods ends in the discovery of the Simpson products. The company announce that their Gas Ranges have sold so fast that a large new factory was made necessary. They are in this factory now and ready to take orders. Their catalogue will be sent to all interested upon application.

JAMES S. LAWRENCE, who, from his long connection with Sam. S. Utter, and recently with John P. Ley, is well known to the Stove trade in the vicinity of New York, has engaged with Peter Ewald, 2933 Third avenue, Borough of the Bronx, where he will utilize his thorough knowledge of the Stove Repair business and see that the orders of his old friends are filled not only promptly but correctly. Mr. Lawrence, in his new connection, places at the disposal of his many friends in the trade an enlarged, well arranged and well equipped Stove Repair establishment, which Mr. Ewald has spent several years in building up.

THE SMITH & ANTHONY COMPANY, Boston, Mass., have prepared a special advance postal card for the use of their salesmen, telling customers of the day that they are likely to visit them and show them the latest improvements contained in their new patterns. A feature of the postal card is a Hub Range mounted on wheels to represent an automobile, with the salesman sitting on the fire box, with his feet in the ash pit, using a poker to guide the progress of the Hub Range along the road to the trade. The postal card is one of the newest issues of the Government, with the national coat-of-arms on one side and a portrait of the late President William McKinley as the stamp on the other.

LYMAN S. BAKER, Camden, Mich., sends us a six-page folder devoted to the Economy Hot Air Furnace. This Furnace is constructed of sheet steel and presents a large heating surface, by means of a rectangular fire

and combustion chamber and four large flues which lead from the combustion chamber to an upper drum. The Furnace is of the self feeding type, although the magazine can be readily removed and wood burned in the furnace in case of necessity. The fire box is 24 x 24 inches in size.

A. C. BARSTOW, president of the Barstow Stove Company, Providence, R. I., sailed for Holland last Saturday on the steamer "Noordam," in company with his daughter. Mr. Barstow will make a trip down the Rhine and visit Venice and Switzerland during his stay abroad. He expects to be home in time for the fall Stove season.

W. H. POOLE of Crawfordsville, Ind., who has received a patent on a new Heating Stove, will erect, in connection with E. D. Bosworth, a factory for the manufacture of the Stove. The concern will also make Sheet Iron Stoves and Heaters, and will eventually embark in the production of Steel Ranges.

AMONG the many useful and unique novelties being distributed by the Michigan Stove Company of Detroit is a wire soap dish bearing the well-known Garland stamp. The idea seems to be that both the dish and the Stove are indispensable and the appropriate place for each is in the kitchen of a well equipped house.

THE KELSEY HEATING COMPANY of Syracuse, N. Y., inform us that C. F. Bock & Son, at Berrien Springs, Mich., have secured the contract for heating the Emmanuel College at that place, in course of construction by the Seventh Day Adventists, and will use Kelsey Warm Air Generators for the purpose. This is said to be the largest warm air heating contract ever made in Southern Michigan and reflects the high opinion held by the committee of experts who selected the heating system of the Kelsey Generator, also their opinion of the capacity of C. F. Bock & Son to install these Heaters in such a manner that every room in the large building will be comfortably heated in the coldest weather.

THE MICHIGAN STOVE COMPANY, Detroit and Chicago, are furnishing their agents with attractive "stickers," consisting of the Garland trade-mark printed in colors on gummed paper, which can be stuck in all sorts of places for advertising purposes. Many dealers use them on all packages which they send out.

A PARAGRAPH in *Printers' Ink* for July 30 states that Frederic W. Gardner of Chicago has purchased the sole advertising rights in the *Philistine* and *Little Journeys*, published by Elbert Hubbard of East Aurora, N. Y. As Mr. Gardner's address is stated to be the Fine Arts Building, we assume that he has already established an office there in which to conduct his business. His many friends in the Stove trade will be pleased to learn that he has formed such a desirable connection and will hope that he may find it not only pleasant but satisfactory in every other respect.

THE PENINSULAR STOVE COMPANY, Detroit, Mich., are sending out two four-page circulars, one devoted to the Peninsular Planished Steel Ranges and the other to the Peninsular Retort, a smoke consuming soft coal and slack burner Parlor Stove, illustrating its economy by means of two coal scuttles of different sizes. The circular shows half-tone engravings of the Retort Peninsular, having a hot blast for smoke consuming, and also the Parlor Peninsular, of similar construction. Both Stoves are designed to feed from the top, have an air tight ash pit, a top hot blast attachment with register and have bodies of finished planished steel, with castings of neat design and handsome nickel trimmings.

In another column the advantages of the Comet Steel Radiator and Stamford All Cast Iron Furnaces, made by the Stamford Foundry Company, Stamford, Conn., are presented, with broken views to show the construction.

THE *Crawford News* is a four-page sheet issued by the Walker & Pratt Mfg. Company, Boston, Mass., in the interest of the Crawford line of Ranges. The statement is made that the Ranges are readily controlled, are sure of operation through special flue construction, and possess other features that are increasing their popularity as a line for the dealer to handle.

THE UNITED STATES REGISTER COMPANY, LIMITED, Battle Creek, Mich., are calling attention to their Jones Side Wall Register. These Registers have double ventilated register boxes and are claimed to provide 50 per cent. more air space than other Registers. The company have made arrangements to be represented by leading houses in all the principal trade centers of the United States.

THE DIGHTON OAK FURNACE, made by the Dighton Furnace Company, Taunton, Mass., is made especially for burning wood and is also well suited for coal, coke or gas as fuel. These Furnaces are made in six sizes, with fire pots from 20 to 31 inches in diameter, and the Furnace in heights from 51 to 62 inches. The general construction is similar to the regular Dighton Furnace, which has become well known as a durable and economical heater.

THE PITTSBURGH STOVE & RANGE COMPANY, Plttsburgh, Pa., claim that the new Good Luck Steel Range is a construction that will fully meet the requirements of the most exacting user. It is built of polished blue steel and possesses all the latest improvements in Steel Ranges.

SOME of the points of merit of the Model Steel Ranges for 1902-1903 that are being offered by the Portsmouth Stove & Range Company, Portsmouth, Ohio, are the fire box, a patented oven door and the special style of damper, which, together with the special oven construction and the fact that these Ranges are made of the very best material and by the best mechanical skill obtainable are calculated to make this style of Range popular in the trade.

THE WHITE-WARNER COMPANY, Taunton, Mass., are calling for agents for their famous "Built to Bake" Household Ranges, which they are pushing with great success in different parts of the country.

THE INTERNATIONAL HEATER COMPANY, Utica, N. Y., are calling the special attention of the trade to their improved pattern of the Palace Queen Warm Air Furnace for coal or wood. The makers claim this Furnace to be a very efficient heater of original design. The arrangement of wrought iron tubes and large combustion space secures an unusually effective radiating surface. The Palace Queen Furnace is made with double feed doors, and one or both may be used as desired.

FURNACEMEN will soon be too busy to make up Pipe, Elbows, Wall Stack Fittings and Supplies. The Chicago Furnace Supply Company, 113-123 South Clinton street, Chicago, offer a wide line of such goods for every day and emergency use in their new catalogue.

THE WALWORTH RUN FOUNDRY COMPANY, Cleveland, Ohio, are making Furnace Rings of steel. This will doubtless be regarded by both manufacturers and dealers as a welcome improvement to Furnace construction. The ease with which cast iron Rings are broken has necessitated a care in packing that has been expensive. The new Rings obviate this expense. The company invite correspondence in reference to this new product.

Michigan Retail Hardware Dealers' Association.

The programme for the eighth annual convention of the Michigan Retail Hardware Dealers' Association has just been issued. The meeting will be held at the Hotel Cadillac, Detroit, August 13 and 14. After routine business at the opening session on Wednesday forenoon, 13th, a paper, entitled "Organization, Local and General," will be read by A. Harshaw of Delray. At the afternoon session the annual address of the president and the reports of the secretary and treasurer will be presented. Papers at this session will be read by J. H. Whitney of Merrill on the subject, "My Faults in Business as Others See Them," and by John Popp of Saginaw, who will discuss the subject, "Would Mutual Fire Insurance Benefit Our Organization?" The Thursday morning session will be devoted entirely to the reading and discussion of the following papers: "Best Methods of Conducting a Retail Hardware Store," by R. G. Chandler of Coldwater; "Retailer's View of a Jobber Who Retails," by B. F. Schumacher of Ann Arbor; "Ad-

vice to the Association of How to Treat An Offending Manufacturer," by H. W. Weber of West Bay City. In the afternoon at the closing session Hon. B. A. Nevins will address the association on "Each Viewing the Other, Consumer versus Retailer." The programme is thus an interesting and instructive one, and with the outside entertainment which will be provided the coming meeting should be one of the most enjoyable in the history of the association.

Berger's Improved Tubular Headlight.

The Berger Mfg. Company, Canton, Ohio, make an extensive line of lanterns of unusual excellence. The accompanying cut shows Berger's improved tubular headlight, which is described as an absolutely safe, reliable, up to date light. This headlight is furnished with either plain or bull's eye globes, and has a No. 2 burner, 1-inch wick, 16-inch hood and 7-inch reflector. It is claimed that it will burn 48 hours in any kind of weather and gives a remarkable volume of light which is rendered specially intense by the concentrating powers of the reflector. It is adapted for lighting boat houses,

Berger's Improved Tubular Headlight.

bowling alleys, dairies, depots, driveways, engine rooms, factories, foundries, sheds, halls, lawns, livery stables, mines, platforms, saw mills, stores, traction engines, warehouses, or other places where a good light is required which will not be affected by strong breezes. The company invite those interested to send for their latest catalogue describing a large and varied line of lanterns, lamps, torches, &c.

"L. & G." Galvanized Ware.

A new catalogue and price-list of their galvanized ware has just been gotten out by the Lalance & Grosjean Mfg. Company, 19 Cliff street, New York, with branches in Chicago and Boston, factories at Woodhaven, L. I., and rolling mill and tin plate works at Harrisburg, Pa. This price-list differs in form from the uniform size and get up which have become familiar in the company's former publications. It is 8 x 11 inches in size, printed on fine paper, and contains some 20 pages covering the entire line of galvanized ware produced by the concern. The illustrations are exceptionally good, and the general get up of the publication is attractive. Among the goods shown are L. & G. cups, measures, scoops, funnels, dippers, wash basins, dish pans, tea kettles, soap dishes, dust pans, chambers, watering pots, refrigerator pans, seamless water pails, fire pails, feeding pans, trays, foot tubs, wash tubs, chamber pails, garbage cans, ash cans, steel baskets and coal shovels. The last page presents views of the company's immense factories at Woodhaven and their rolling mill plant at Harrisburg, Pa.

Rochester Lamp Company.

N. E. Tallman, who has been in the service of the Rochester Lamp Company, 38 Park place and 33 Barciay street, New York, for a period of nine years in various capacities, has been made secretary of the company, succeeding Edward H. Kinney, the former secretary, who has resigned to become treasurer of the George H. Tay Company, San Francisco. Mr. Tallman will have direct charge of the details of the business at 38 Park place. It will be recalled that the Rochester Lamp Company, under the entirely new management of the past year or so following the death of Charles S. Upton, its founder and president, until his decease, established a well equipped factory of their own, with modern and improved machinery, at Twenty-fifth street and Tenth avenue, New York, where they are now manufacturing both the Rochester and New Rochester lamps of which they are sole owners and patentees in the United States and foreign countries, together with important and well introduced lines of blue flame wickless and odorless cook stoves, portable oil heaters, gas chandeliers, brackets, portables, lamp trimmings and specialties of this character covering a wide range, the product of which is almost as well known abroad as at home. It is the purpose of the interests now in charge of the property to energetically extend and broaden the market for the Rochester line, all the details of which manufacturing and marketing they now control, enabling them to execute promptly orders from both domestic and foreign buyers.

The Lawson Clothes Line Reel.

The accompanying cut represents a clothes line reel being put on the market by the Lawson Mfg. Company, Chicago, Ill. The reel is provided with a wire brake

The Lawson Clothes Line Reel.

controlled by the thumb of the hand which holds the handle, while the rope passes through a loop made by two wires extending from the axle beyond the circumference of the wheel. The pressing together of these wires catches the rope and holds it securely. The wheel is made of galvanized wire and the holder of galvanized iron with a wooden handle attached. The reel is referred to as being simple and practical.

Bakers', Confectioners' and Hotel Goods.

A catalogue of 126 pages, copiously illustrated and attractively arranged, is being issued by the August Maag Company, 107 Sharp street, Baltimore, Md. This publication covers the line of bakers', confectioners', hotel and cooks' goods manufactured by the concern named. Among the goods shown are several styles of portable ovens, the Eureka oven illuminator, bakers' lamps for oil and gas, oven doors, dampers, grate bars, tiles, mixers, egg beaters, whisking machines, sifters, strainers, dough troughs, sieves, baking pans and a large variety of molds, cutters and other goods used by bakers and confectioners. Sweetmeat and candy furnaces form another line, followed by a complete stock of confectioners' tools and appliances. A great variety of goods for use in hotel and restaurant kitchens complete the catalogue. The company are also sending out a separate catalogue and price-list of 42 pages, showing their line of ice cream utensils and supplies. These embrace freezers, pails, beaters, ice breakers, molds, steel packing and shipping cans, ice cream refrigerators, paddles, scoops, strainers, spoons, ladles, measures, cream cans, water coolers and a number of other articles suitable for

the use of manufacturers and dealers in ice cream and kindred supplies.

The Dewey Stock Fountain.

On many farms and at some seasons the value of water is a matter of importance, and yet provision must be made for the stock to secure all that they desire without restriction. With a view of preventing a waste of water, and yet always having an ample supply at hand, the B. B. Mfg. Company of Davenport, Iowa, have put on the market the Dewey stock fountain. In Fig. 1 a sectional view of the automatic supply arrangement

The Dewey Stock Fountain.—Fig. 1.—Sectional View of Automatic Supply Cock.

is presented, from which it can be seen that by means of a ball cock the supply is automatically governed. Fig. 2 shows the attachment to the watering trough, two drinking founts being provided. As will be seen, the supply pipe is connected at D. Immediately upon the water in either of the founts being drunk by an animal the supply in the chamber with the ball float will be reduced, causing it to fall and open the supply valve. It is claimed that this fountain is especially valuable to hog raisers, as it provides a continually accessible supply of pure water which increases the fat and muscle and avoids the sickness due to impure water. These foun-

Fig. 2.—The Supply Apparatus Connected with the Fountains.

ains are said to have a large sale in the corn growing States, about a quarter of a million of them now being in use.

THE Fourth of July exhibit of George W. Myers, Stove and Hardware dealer, at South Bend, Wash., was voted to be the best in that city. In one of the show windows were potted plants surrounded by Stransky Enameled Ware, and in the other a miniature battle ship, made up of articles sold in the store. Two Symonds Saws constituted the hull, a Savory Roaster the deck-house, while Mouse Traps were used for turrets, with Cartridges for guns. The rigging was formed of Wire, and Brass Hose Nozzles represented the long range guns, with small Elbows serving as ventilators.

COLD AND HOT WATER SERVICE AND CIRCULATING PIPING.

BY HELMAR.

Circulating jobs are most necessary where the bathroom is remote from the kitchen. The circulating pipe is seldom installed where the bathroom is directly over the kitchen, as indicated in the accompanying sketch, but it provides a great convenience in any job—that of being able to draw hot water from the bathroom faucets almost instantly after opening them. Without the circulating pipe more or less water must be drawn, according with the length of pipe between the bathroom and the boiler, before the “dead” water has been forced out and enough hot water passed through to warm the pipe, which must be done before hot water can be had at the faucets. If the kitchen is in the basement it is usual to run the circulating pipe between the hot and cold pipes and place the cocks controlling the bathroom supplies over pantry sink, if convenient. If the stops on the bathroom supplies must be placed in the kitchen the

Cold and Hot Service and Circulating Piping.

location shown is the best. Stops placed high up are not convenient, but if the supplies are dipped to get them lower the circulation feature will fail under all ordinary conditions.

Bulb air chambers are shown in the sketch. These can be made by the plumber of lead or iron, or brass chambers may be purchased. Where a supply drops to a faucet, as shown, it is best to place the faucet at the lower end of the pipe, so that the faucet will drain the pipe empty. Plain pipe air chambers could be used in the job shown by placing a tee between two elbows for the hot faucet, letting the air chamber stand up outside the line, and branching the cold faucet in to match. This plan would place the faucet at the lowest point in the hot service, but the piping does not look well unless the splash back is in front of the pipes, as it always should be.

The circulating pipe is not often carried nearer to any of the faucets in the bathroom than is indicated in the sketch. It must have a stop and waste cock, which should, when practicable, be placed beside the stop and waste on the hot service, because they must always be turned at the same time and if separated the cock on the circulating pipe might be overlooked. The circulating pipe should connect to the lower pipe of the stove connection, or between the sediment cock and the boiler. It is usually one size smaller pipe than the hot service.

A dip in the hot service, such as is made to get stop cocks over the sink, is not always a barrier to circulation. If the hot service can be carried one or two stories higher than the bathroom and then return in the usual

way, the extra surface in the return pipe of the loop thus made will cool the water sufficiently to pull the water through the dip, if everything is favorable. The flow pipe of the loop should be insulated. A suction tee used in the stove connection where the circulating pipe joins will aid a job where a loop is used to induce circulation. Irregular work of this class is, however, as a rule, better left undone.

The New Departure Bibbs.

Many plumbers have confined themselves to the use of heavy brass goods in order to avoid trouble from thin places in bibbs, &c., due to lack of care in the details of manufacture. A new line of brass goods is being

The New Departure Bibbs.—Fig. 1.—Sectional View, Showing Uniform Thickness of New Departure Bibbs.

put on the market under the name of New Departure by the New Departure Mfg. Company of Bristol, Conn., whose selling agents are John H. Graham & Co., 113 Chambers street, New York. In Fig. 1 is shown a sectional view of a New Departure bibb which was sawed apart by the manufacturers in order to disclose its constructive merit. Special attention is drawn to the uniformity of the thickness of the bibb at the different points. A study of this bibb vindicated the company's idea of the necessity of perfecting the details of manufacture, so that the bibbs which are turned out by the concern should be uniform in thickness throughout. The sectional view presented in Fig. 2 shows a bibb such as the trade is familiar with. The variation in thickness shown at different points, which tends to cause breaking under a strain, cannot be overcome by mere weight of metal alone. It is due to the lack of

Fig. 2.—Sectional View, Showing Defective Construction.

care in the manufacture of brass goods brought out to meet the sharp competition that has existed in this branch of trade.

The manufacture of brass goods is an old industry with the New Departure Mfg. Company, but on taking up the manufacture of plumbers' brass goods they have carefully studied the details and now claim that they have the plant, facilities and experience for turning out brass goods made from the right material and of a uniform thickness, so that excessive weight and consequent cost is not necessary to secure a perfect and strong bibb or stop cock. The company have recently issued a 22-page catalogue devoted to the line of goods which they are already making, and which they announce that they intend to extend until their assortment is as complete as any line of plumbers' brass goods on the market.

Stealing Water.

Righteous indignation has evidently instigated the following observations in *Fire and Water* in reference to individuals and business concerns who, it appears, seem to have been taking for years without expense that which they knew the city expected them to pay for. That in some instances bribes were paid to dishonest officials aggravates rather than palliates the offense:

Now that the highest court in the State has decided that the authorities of the city of New York enjoy the right to cut off the water supply of persons who have been stealing water through unmetered pipes, and to keep it cut off until they pay for what they have stolen—as the amount may be estimated by the city officials—it is to be hoped that this common sense opinion will be acted up to and the law enforced without fear or favor. Such thieves belong to a very low order in the ranks of their calling, although unfortunately many of them are people who occupy a respectable position in life. In addition to their being obliged to refund with interest and costs the money of which they have robbed the city, their names should be published in every paper and in the most conspicuous part of every paper printed in New York. The practice would then soon cease as one at least unprofitable from a dollar and cent standpoint.

A recent decision of the Appellate Division of the Supreme Court makes it easier for the Commissioner of Water Supply, Gas and Electricity of New York to fight those who surreptitiously "convey" water from the city pipes for their own use without paying for it. The decision was the outcome of an application on the part of a hotel keeper for a mandamus to prevent the Water Department from interfering with his water supply. Last March one of the Commissioner's inspectors found that the water meter in the hotel had been tampered with; that several of the teeth in the cog wheels had been filed off; that the seal had been broken, and that the meter had been set back on several occasions. Commissioner Dougherty sent for the hotel keeper, who pleaded ignorance of the whole affair. The Commissioner told him that unless he paid his water bill in full his water would be cut off. Before the department had a chance to carry out its threat, however, the hotel keeper obtained a mandamus, which has just been set aside by the Appellate Division. The decision is of much importance to the Water Department, and will aid Commissioner Monroe materially in proceeding with the work of suppressing water frauds by giving him absolute power to cut the water off under such conditions.

The Aerated Fuel Process.

The Gilbert & Barker Mfg. Company of Springfield, Mass., and 82 John street, New York, issue a 64-page publication entitled "The Aerated Fuel Process." On opening the catalogue is found a plate page showing a fuel tank buried below the surface of the ground, for supplying the forges and other fires of a metal stamping establishment with gas from liquid fuel. An air compressor is shown for forcing the liquid fuel from the fuel tank to the burners in the various devices in which the aerated fuel is to be burned. General and sectional views are also presented of the company's aerated fuel burner, by means of which the fuel and compressed air are forced as a blast into a chamber where the articles to be heated are placed. The catalogue also shows fuel tanks and fuel packages, air compressors and automatic single oil pumps and receivers, as well as duplex oil pumps and receivers, designed for equipping establishments for forging, welding, japanning, enameling, annealing brass and copper, firing terra cotta kilns, burning sewer pipe, evaporating salt, cremating garbage and various other purposes. Forty pages contain testimonial letters which afford much interesting information as to the use to which the aerated fuel process can be put. The detailed description given of the operation and construction of the devices is also of much interest.

THE COLWELL LEAD COMPANY, 63 Centre street, New York, are inclosing with their communications circulars devoted to Smooth On, a Silicated Iron Cement for making tight joints in cast iron. The circular gives instructions for its use and contains many testimonial letters from those who have employed it on plumbing, piping, hot water piping, and for other purposes.

A New Sun Ray Boiler.

With a view to providing a boiler especially adapted to the needs of steam fitters who cater for the heating of the smaller type of residences the J. L. Mott Iron Works, 84-90 Beekman street, New York City, have put on the market the Sun Ray boiler, shown herewith. A general view of the boiler equipped with the steam trimmings is presented in Fig. 1. Another illustration of the boiler, given in Fig. 2, shows it with a portion of the trimmings removed, so that the construction can readily be seen. The boiler is in many respects similar to what

A New Sun Ray Boiler.—Fig. 1.—General View of Boiler with Steam Trimmings.

is known as the "dog house" type of boiler, which has become very popular for the smaller class of buildings. A feature of great convenience is its sectional construction, facilitating its introduction into a building through the ordinary doors and windows, and with comparatively little help, inasmuch as none of the sections are too large to be readily handled by the steam fitter and his helper. It is provided with an ash pit section, equipped with a labor saving grate of the approved type. This affords a substantial support for the sections of which it is composed. The push nipple construction has been adopted for connecting the sections, and the capacity of the boiler can be varied by the number of sections used. These goods are made in a variety of sizes, rated to carry from 250 to 750 square feet of direct

Fig. 2.—View Showing Internal Construction.

steam radiation, and having grates 19 and 20 inches wide, increasing 6 inches in length with the addition of each section. The boilers are rated to carry from 300 to 1250 feet of hot water radiation. They stand 52 inches high complete and have a water line 42 inches high. From this it will be readily seen that they are well adapted for low cellars. In the construction a large steam space and large water passages are provided, as well as a large fire surface, as the products of combustion rise into the outer side flues and pass to the front, where they reach the central flue and pass to the smoke outlet, whereby a maximum of heat is utilized before escaping. The company have recently issued a new catalogue giving full particulars in reference to their complete line of Sun Ray boilers and radiators.

The Gem Water Heater.

The variety of uses for which the Gem water heater is adapted has already given this device a considerable popularity, although it has been but recently put on the market by F. Schifferle, 1244 South Broadway, St. Louis, Mo. It consists of a sheet copper chamber arranged to

The Gem Water Heater.

be partly submerged in a body of water in a bathtub, so that the water can be heated by means of a gas burner which is inclosed within the walls of the heater, from which the products of combustion are carried off by means of a flue at one end. These heaters are made 21 inches long, 10 1/2 inches wide and 10 inches deep, having a total weight of only 16 pounds, so that they can be readily handled by women and children. When placed in the bathtub it is only necessary to attach the gas hose to the burner, turn on the gas and light the burner through the special tube for that purpose, when the water in the bathtub will be heated in a short time. It is claimed that 20 gallons of water can be heated in less than 20 minutes. The heater presents 500 square inches of heating surface and can be used for heating water in laundries, also for heating a quantity of water in any kind of a vessel where gas is available. The heaters are also arranged to be equipped with gasoline burners. The workmanship and materials are of the best character, and it is claimed that with ordinary use the heater is practically indestructible.

Contract for Large Fans.

A letter from the Buffalo Forge Company, Buffalo, N. Y., informs us that among the recent contracts awarded to the house is one of particular interest from the Continental Coal Company of Glouster, Ohio. This order is for three 250-inch fans, to be installed in their mine for the purpose of ventilating and exhausting fumes, smoke and the dangerous gases constantly arising in coal mines. The fans, which are almost 21 feet in diameter, are of the three-quarter housing type and of the special width of 72 inches. The slides are built of extra heavy steel plates and are thoroughly braced with angle irons of ample size to effectually prevent vibration. The blade wheels of these fans are of the usual centrifugal type. The radial blades or vanes, with backwardly curved tips, are supported by two spiders of wrought iron, tees springing from cast iron hubs, and are further stiffened by conical side plates. The fan shaft is supported independently of the housing by two Standard Buffalo self aligning chain oiling outboard bearings mounted on masonry pedestals. This plant, when completed, will be similar in many respects to

that of the Modoc Coal Mining Company, located at the same place, which was recently installed by the Buffalo Forge Company.

The Monitor Pipe Holder.

Those who make a specialty of pump work and all who have occasion to handle long lengths of iron pipe in a vertical position will find convenience in the use of the Monitor pipe holder, shown in the accompanying illustration, which is made by the Chandler Pump Company, Cedar Rapids, Iowa. This pipe holder is strongly made and has been tested to support a weight of 5 tons.

The Monitor Pipe Holder.

oughly tested by practical pump men who have occasion to lift pipes from shallow and deep wells for various purposes, and has been pronounced by them a thoroughly practical device, excellently well adapted for the purpose.

Of special interest, owing to the coal strike and the scarcity of anthracite fuel, is the new equipment of the Torrid Steam and Hot Water Heaters made by W. H. Drake, 36 Clinton street, Newark, N. J., as shown in his advertisement in another column. The claim is made that the Boilers will burn the finest coal successfully.

Bathtub Equipments.

The facility with which special sanitary devices can be manufactured and the reasonable prices at which they are sold has led to their being extensively used by the plumber, notwithstanding that he may feel some regret at having so little occasion to do the lead work, in which there was an opportunity for him to display his skill and in which he took a great deal of pride. The A. Y. McDonald & Morrison Mfg. Company of Dubuque, Iowa, have brought out a series of new devices

Bathtub Equipments.—Fig. 1.—The Twentieth Century Trap.

to aid the plumber in making bathtub connections. One of their principal fixtures is the Twentieth Century drum trap, shown in Fig. 1, which is made of cast iron, having a 4-inch outside diameter and with inlet and outlet tapped for screw joint connection. The top of the trap is reinforced around the outer rim and threaded to receive the nickel plated brass screw top, which extends beyond the diameter of the trap, so that it may rest on the floor, and which is provided with a $\frac{7}{8}$ -inch square nut, so that it can be readily removed with a

Fig. 2.—Sectional View of Trap.

wrench. A sectional view of the trap is given in Fig. 2, and its connection with the bathtub in Fig. 3. From these it will be seen that a body of water rests not only in the trap but in the pipe leading to it. This trap can be used in connection with any connected waste and overflow, and with different kinds of bathtubs.

In order to facilitate the connection of the waste and overflow with the trap proper the concern have brought out the special brass, nickel plated slip joint connection shown in Fig. 4. This is made 5 inches long, allowing considerable variation to accommodate different lengths of bathtub legs or unevenness in the flooring. A tight joint is made around its upper surface by means of a special form of tee that is used in connection with it.

Another specialty adapted for use with the supply and waste pipes to any plumbing fixture, which is shown in Fig. 5, consists of a new type of floor flange,

Fig. 3.—Showing Trap Connected with Bathtub.

which is threaded above and below, the lower portion being threaded for $\frac{1}{2}$ -inch wrought iron pipe, while the upper end is threaded for $\frac{1}{2}$ -inch and $\frac{3}{8}$ -inch brass, nickel plated or wrought iron pipe. The floor flange, as shown by the cut, can be used either as a direct pipe connection or with a slip joint for different sizes of pipe

Fig. 4.—A Slip Joint Connection.

on the upper end, so as to allow more variation in the height of the fixtures and avoid the necessity of cutting the pipe to the absolutely correct length. It is claimed that with these devices a bathtub can be connected by the plumber with less labor and less time than by the

Fig. 5.—Floor Flange for Supply Pipes.

old methods with lead traps and piping. It also affords a character of equipment that cannot be destroyed by rats or dented by workmen or penetrated by the nails and screws of the carpenter. All of these advantages will be readily appreciated by the practical man. The company are distributing circulars illustrating and giving detailed description of these various bathtub equipments.

The Field Automatic Basin Cock.

The desirability of preventing any loss of water at the various fixtures of a plumbing system has led to the production of a number of self closing faucets. In the accompanying illustration we show one of the ball pattern basin cocks, which are made in a variety of styles by the Field Automatic Valve & Faucet Mfg. Company, 168 Dorrance street, Providence, R. I. These cocks are closed with water pressure, and as they close automatically and slowly they prevent water hammer. In their construction no springs are used, nor are there any stuffing boxes to get out of order. No stem packings are used, the only packing being in the valve seat, where it is arranged in a recess to avoid the wear of the water passing over it. It is claimed that the Field cocks will work readily in a battery, supplying a number of fixtures on cold water and hot water supplies alike. Another advantage they possess is that if the water is shut off from a building they will allow the water to drip from the pipes and prevent freezing. When the water is turned on again they will close as soon as the water pressure arrives at the fixture, thus preventing waste. These basin cocks have been thor-

The Field Automatic Basin Cock.

oughly tested in a number of large buildings and factories in New England, and are recommended as being first class in every respect.

American Spiral Pipe Works.

Spiral Rivet Pipe is the subject of a late catalogue of the American Spiral Pipe Works, 64 Wabash avenue, Chicago. The merits of this pipe are well known. It possesses strength, tightness, lightness and durability. It is supplied by the company asphalted, galvanized or double galvanized as may be desired. In both the asphalted and galvanizing the pipe is immersed in the fluid, thus securing perfectly coated inside and outside surfaces. If desired for pressure uses of either water or steam it is subjected to hydrostatic tests sufficient to allow for an ample margin of safety. The standard length of spiral rivet is 20 feet, but the asphalted pipe can be furnished in lengths up to 25 feet. It is furnished up to 16 inches in diameter and of different gauges of steel. The catalogue also illustrates and describes the connections used with pipe of this character.

Purdy's Pipe Clamp.

William Purdy, 222 Ninth avenue, New York, is the manufacturer of Purdy's pipe clamp, as here illustrated, which has been in use in the New York market for some time, but not introduced outside of that territory. These clamps are intended for use in emergencies for the immediate repair of leaks in all kinds of steam and water pipes, under any pressure, thus avoiding the immediate necessity of shutting down a plant for repairs, this device making it possible to repair the leak as soon as discovered, taking a more convenient time to cut out and

Purdy's Quick Repair Pipe Clamp.

renew a defective pipe. It is especially recommended for use by engineers, men in charge of pumping machinery, steamboat men, the janitors of buildings, and others using pipe for the purposes alluded to. The clamps are made in three sizes: No. 1 fits $\frac{1}{2}$ to $\frac{3}{4}$ inch pipe; No. 2, 1 to $1\frac{1}{2}$ inch pipe, and No. 3, 2 to $2\frac{1}{2}$ inch pipe. The strap is made of cold rolled steel, the No. 1 size being 18 gauge and the two larger sizes of 16 gauge. The steel strap of the smallest size is $4\frac{3}{8}$ inches long and $2\frac{1}{2}$ inches from top to bottom. In use the bolt and nut are removed, the strap slipped around the pipe, when the bed block covering a strip of rubber sheet backing is slipped over the leak and firmly secured in position by tightening the hexagonal head screw.

A Fine Plumbing System.

One of the finest systems of plumbing ever installed in a public building in this section of New England, says the *New Haven Record*, is that recently completed by the Buckingham-Routh Company in the new Malley Building, New Haven. On each of the seven floors of the building is fitted up a spacious toilet room, with four closets, slop sink, lavatory, &c. The partitions and wainscoting are all of Italian marble, the wood work being ash, finished in a dark color. The Durham system of plumbing has been used and the fixtures are mostly the Peck Bros. & Co.'s goods. In each of the rooms throughout the building is a lavatory, with marble bowl and open fixtures, and in the hall of each floor is a marble fixture for supplying ice water from a large cooling tank on the roof, as well as a water supply for fire purposes. Water is supplied from driven wells pumped into a 5500-gallon tank on the roof. The whole contract has been exceptionally well carried out and the owners have expressed much satisfaction with the manner in which the work has been done.

C. H. BROMLEY, New Britain, Conn., has just completed a contract for some first-class plumbing in a two-family house for Adam Zahnleiter. He also has completed contracts for George Unwin, Richard Malin and A. E. Morey. Among other contracts is one for E. Yates. Mr. Bromley reports a large increase in the summer's business and states that he is doing double the amount of work this season that he did last.

The Efficiency of Acetylene Generators.

The following information, taken from the *Plumber and Decorator* of London,, will be of interest to all who are using acetylene generators:

The Chief Inspector of Explosives recently called together a committee of scientists, expert in judging generators, and then issued an invitation to the trade to send their generators in to be tested and reported on. The report is now issued, and is—failing some further particulars—unsatisfactory. It is said that of the 46 generators tested all gave evidence of being safe; but while this is consoling, there appears to be a terrible injury done to some makers in the percentage of possible yield of gas that is published against each machine.

The committee say that a generator should have a 90 per cent. efficiency to be considered safe, this meaning that, with carbide yielding 5 feet of gas per pound the generator must give $4\frac{1}{2}$ feet for every pound used. This is not expecting too much, but 24—or more than half of the generators—failed to do it. And why?

A loss of gas between the generating chamber and the holder or burners can occur in two ways. One is by a bad form of generation (using too little water usually) causing intense heat and polymerization of the gas (with excessive production of impurities); the other is the absorption of acetylene by water. Any generators guilty of the former deserve to have their record published, but with the latter a proper allowance should be made and placed to the credit of the "percentage of possible yield" column. A number, if not the majority, of acetylene engineers consider that the gas should be cooled on passing from the generating chamber. This usually means providing a receptacle of water for the gas to bubble through. The gas is thus cooled, and all condensable products or vapors are removed. Water, however, absorbs acetylene; roughly speaking, a foot of water will absorb a foot of acetylene, but let it be clearly understood that once the water has its share it does not absorb the gas perpetually. After it is satisfied (saturated) the gas will pass through without loss, and the full yield will go to the holder and burners.

Among the 26 unfortunates the writer knows several to be provided with water expressly for this washing, and the question is: Was the water saturated with acetylene before the test or was a suitable allowance made? The report says nothing, and it is very hard on the 26, or a good many of them.

Pipe Coils.

Farwell & Rempe Company, Sacramento and Carroll avenues, Chicago, manufacturers of wrought iron pipe coils, announce that with their increased facilities they are enabled to meet the wants of customers with a greater degree of promptness. Their illustrated catalogue of coils, manifolds, ammonia fittings, &c., is of special interest to manufacturers of ice and refrigerating machines, feed water and car heaters, as well as to cold storage houses, chemical works, blast furnaces, soap factories, &c. The catalogue is provided with an index for ready reference, and is reinforced by a number of valuable tables, specially designed to the needs of their customers.

PROF. WILLIS L. MOORE, Chief of the United States Weather Bureau, at Washington, D. C., has recently perfected an apparatus for cooling buildings by which the warm air is taken from the outside of a building and in passing through the machine is dried, washed and cooled before it enters the room. The whole operation is dependent upon the difference in the specific gravity between warm air and cool air. The machine is said to work automatically, faster when the air is hot and more slowly as the temperature falls. The apparatus is filled with a cooling mixture and may be readily mistaken for a large stove. It has been in experimental operation for some time, but the mildness of the summer weather has interfered somewhat with its exploitation.

Heating and Plumbing Notes.

THE Detroit Association of Master Plumbers have lately fitted up a large room in the Wayne County Savings Bank Building, Detroit, where they hold their regular meetings and the members come together daily for the consideration of matters pertaining to their business. We are glad to state that *The Metal Worker* is held in sufficiently high esteem to be kept on file in the rooms.

MANHATTAN BRANCH of the Association of Master Plumbers of New York City have arranged to hold their annual outing and clambake at the Hotel Crocheron, Bayside, L. I., on Thursday, August 28. The committee in charge consists of T. J. Cummins, Alex. Bryant, John Rinehan, T. J. Tuomey, J. W. O'Brien, T. F. Gaynor and A. W. Reynolds. Tickets can be obtained from A. W. Reynolds, treasurer, 2110 Broadway, or from any of the committee.

J. W. ANDREWS of Tremont, Neb., bid \$1760 and secured the contract for equipping the Carnegie Library building in that place with a steam heating and lighting system.

J. J. FITZGERALD, clerk of the Board of Education of Waterbury, Conn., will receive bids until August 11 for plumbing, heating and ventilating the new school building to be erected in the Washington Hill district.

W. D. HALL AND JOSEPH A. MURRAY, representing Joseph L. Dunn & Co. of Wilkes-Barre, have been in Lancaster, Pa., preparing plans for the steam heating plant in which capitalists of Wilkes-Barre and the Wyoming Valley are interested.

THE following journeymen have been granted plumbers' licenses by the Plumbers' Examining Board of Bridgeport, Conn.: Martin Fitzgerald, D. J. Farrell, Edward Killian, John McRean, Thomas Constant, Ray Alvord, William Madigan, John McCormick and C. D. Reiley. Three others failed to pass the examination.

EDWARD H. KINNEY, who for about 20 years had been identified with the Iron Clad Mfg. Company, New York, and who for a brief period has been secretary of the Rochester Lamp Company, New York, has been chosen treasurer of the George H. Tay Company, San Francisco, Cal., and left for the Pacific Coast July 29, to assume the duties of his new office, which will be in the way of joint management of the company with Francis J. Baker, secretary. The George H. Tay Company have long been favorably known as wholesale dealers in Plumbers' Supplies, Stoves, Ranges and kindred merchandise.

G. JAGER has recently connected himself with the Charles Graham Chemical Pottery Works of Brooklyn, N. Y., and will visit the plumbing trade in the interest of their Laundry Tubs, Sinks and other Sanitary Earthen Ware.

JAMES T. KAY, Meriden, Conn., is doing the plumbing at the Meriden Hospital, and also has a contract for the plumbing and gas fitting in the First Congregational Church at Naugatuck. He has just completed the plumbing in the Mohican Building, New London.

THE ELM CITY ENGINEERING Co. of New Haven, Conn., describe their Magnetic Separators in a pamphlet. A point of superiority of this machine is that the magnetic cylinder is always of the same size, a point that is very essential to the satisfactory working of the Separator. All parts of the machine are made in the most careful manner, and the best material only enters into its construction. The machine has a capacity of from 3000 to 10,000 pounds of stock in ten hours according to the material used. It is designed to operate at a 110-volt circuit and consumes 4.3 amperes.

ANDREWS & CREEDON of Hartford, Conn., have the contract for installing a Royal Hot Water Heater and 2500 square feet of New York radiation in the Home for Incurables in that city.

THE contract for heating and ventilating the new Court House at Norristown, Pa., has been awarded to Miller & Sons at their bid of \$14,000. The contract for the lighting was awarded to E. P. Strong & Co. at their bid of \$7061.

EVANS, ALMIRALL & Co., 45 Dey street, New York, bid \$8000 and secured the contract for a hot water heating system, to be installed in the Clark Library, at Worcester, Mass.

THE FOSTORIA HEATING COMPANY, recently organized at Fostoria, Ohio, with \$100,000 capital stock, will commence immediate work on the installation of a Yaryan heating system.

KLOCKSIN & SENIOR, Summit, N. J., have the contract for plumbing and heating a fine residence for J. Long and another for A. A. Henning.

J. W. ARBOTT of the Standard Sanitary Mfg. Company of Pittsburgh has gone to Europe.

AN ordinance has been adopted at Des Moines, Iowa, requiring the inspection of all plumbing work.

THE foundry of the West Superior branch of the United States Cast Iron Pipe & Foundry Company will resume operations about August 1, it having been closed down for repairs and to await the disposal of a large stock of Sewer and Water Pipe now in the yards of the company. The machinery is being cleaned and repaired and the plant is being put in condition to enable it to continue operations for at least a year's run.

THE strike in the plumbing trade at Richmond, Va., has been adjusted, largely through the influence of Morgan R. Mills, president of the Master Plumbers' Association, and William J. Spencer, the general organizer of the Journeymen Plumbers' Union, from the Chicago office. A feature of the settlement is the appointment of a special advisory committee, composed of members from the Master Plumbers' Association and from the Journeymen's Union, who will arrange for a new agreement at the expiration of the present agreement, which holds for one year.

WILLIAM R. C. CORSON, consulting electrical engineer, 440 Capitol avenue, Hartford, Conn., is supervising the installation of power and heating plants for the Pratt & Cady Company and the Sigourney Tool Company, both in that city.

NATHANIEL MORTON, who has been treasurer of the Bradford Joint Company, Plymouth, Mass., since their incorporation in 1871, died at his home on July 18, aged 71 years. Mr. Morton was a man of rare public spirit and his death is universally lamented.

THE Supervising Architect at Washington, D. C., will receive bids until September 10 for plumbing, heating and lighting the Post Office at Anniston, Ala.

THE KEYSTONE BOILER & RADIATOR COMPANY, Huntingdon, Pa., who some time since purchased the old works of the Huntingdon Car Mfg. Company, with several acres of land, have increased their force and extended their plant to meet the demands made for the Keystone Boiler, which has met with a favorable reception wherever it has been investigated by heating contractors.

THE Supervising Architect, Washington, D. C., will receive bids until August 25 for heating and electric wiring an extension to the United States Post Office and Custom House at Frenchman's Bay, Ellsworth, Maine.

J. T. KERR, Dover, N. J., is installing a No. 92 Royal Steam Boiler, made by the Hart & Crouse Company, Utica, N. Y., in the Richards Block, at Dover, and is rearranging a steam heating system.

THE UNITED STATES HEATER COMPANY, Detroit, Mich., are said to have recently purchased a large piece of ground adjoining their present works, on which they are prepared to erect an important addition to their present plant.

R. J. MOONEY, Summit, N. J., is installing a No. 46 Royal hot water heating system in the rectory of St. Teresa Church, using 800 feet of New York Radiation.

THE CELLUVARNO COMPANY, Newark, N. J., make a specialty of covering water closet tanks and seats, bathtub seats and all wood work or brass work used in bathrooms with a patented preparation which, it is claimed, remains white and hard at all times. We are advised that the company have recently reduced their prices for treating tanks and seats in this manner. They are well

equipped to do this work, the seats and tanks being furnished by the owner.

S. FAITH & Co. of Philadelphia, Pa., bid \$127,300, which is said to be the lowest bid received by James Knox Taylor, Supervising Architect of the Treasury Department, for installing the mechanical equipment, heating and ventilating system in the United States Mint at Denver, Col.

W. R. MILLOWAY, 519 South Ohio street, Sedalia, Mo., has instituted proceedings against what he alleges is an organized attempt to drive him out of the plumbing business and prevent him from securing supplies.

ENGINEER GREGORY of the Yards and Docks Department at Portsmouth, N. H., has commenced work on the plans for the proposed central heating station to be inaugurated there. The heating will be done by means of hot water circulation.

WORK has been begun on the new foundry of the Barberton Brass Valve & Fittings Company at Barberton, Ohio.

ABOUT 3500 tons of Wrought Iron Pipe were forwarded in June from the various mills of the National Tube Company, through Eastern ports, for shipment to various parts of the world, principally to Continental Europe.

THE WEST PLAINS PLUMBING COMPANY, West Plains, Mo., are plumbing the building of T. B. Kilpatrick at that place.

R. H. CARPER of Salem, Va., has secured the contract for plumbing three barracks at the National Home for Disabled Volunteer Soldiers at Johnson City, Tenn., involving \$20,000 worth of work. He also has a similar contract at Blacksburg, Va., and for a residence in the same place.

PORTER & Co. bid \$4000 and secured the contract for heating the Central High School building and the Longfellow School at Minneapolis, Minn.

New Firms and Changes.

THE AMERICAN CARBOLIDE COMPANY of New York have been incorporated with a capital stock of \$1,000,000 to manufacture Calcium Carbide, Carbolide and similar products. The directors are Charles A. Towne and Walter G. Hudson of New York, Charles E. Hartman of Boston, William Nicholson and W. M. Hoffman.

F. POWERS of Chicopee Falls, Mass., will occupy one of the new rooms in the Arcade Building at New Milford, Conn., as a plumbing establishment. As he is just entering the business, Mr. Powers will be glad to receive catalogues and prices of plumbing goods.

THE PHILLIPS HEATING COMPANY have been incorporated at Augusta, Me., with a capital of \$50,000 to install all kinds of heating and ventilating systems. F. L. Dutton is president and E. F. Whittum treasurer.

AN error was made in the amount of the capital of the American Valve & Meter Company, Cincinnati, Ohio, in a recent issue of *The Metal Worker*. The new company are a consolidation of the Cincinnati Meter Company and the John N. Poage Mfg. Company, and have a capital of \$330,000. They will make Water Meters, Water Columns, Tank Fixtures, Valves and Railway Supplies. N. Paul Fenner, Jr., is president and general manager, William Porteous vice president and superintendent and Frank M. Foster secretary and treasurer.

THE FOSS VALVE MFG. COMPANY are a new industry in the old Crawford factory, at Dover and Warren streets, Brockton, Mass., who will manufacture the Valves and Faucets patented by Walter O. Foss. Clarence E. Anglim is manager of the concern.

Some metals have a very much more pronounced odor than others. The odor of tin, especially when newly cut, is unmistakable, but it is a moot point whether gold and platinum have any odor that could be recognized by human olfactory nerves. Of the rarer metals uranium and its compounds give the strongest odor. Uranium is always giving off what are known as the Becquerel rays, consisting of streams of excessively minute "corpuscles."

Where Our Manufacturing Exports Go.

The frequently asked question, "What becomes of our exports of manufactures?" is now definitely answered by the Treasury Bureau of Statistics. While it has been practicable to show the countries to which any given article is sent in any given year the figures of the Bureau have not formerly been so adjusted as to render it practicable to determine what share of the total exports of manufactures was sent to a given country or division of the world; or, in other words, the location of the principal markets for American manufactures. These facts are now shown by a series of tables compiled by the Bureau. They show that during the year 1901 52 per cent. of the manufactures exported went to Europe, 23 per cent. to North America, 6.6 per cent. to South America, 8.2 per cent. to Asia, 7 per cent. to Oceanica and a little less than 3 per cent. to Africa. The total value of manufactures exported to Europe in 1901 was \$215,000,000; to North America, other than the United States, \$96,000,000; to South America, \$27,000,000; to Asia, \$33,700,000; to Oceanica, \$29,000,000, and to Africa, \$10,500,000.

The largest item in each case was iron and steel manufactures, Europe taking them to the value of \$43,812,323; North America, \$13,518,293; South America, \$8,754,800; Asia, \$8,992,967; Oceanica, \$8,371,602, and Africa, \$2,368,635. Refined oils, copper, leather and agricultural implements, in the order given, were, next to iron and steel, the most important manufactured articles exported from the United States in 1901.

In conjunction with the tables showing the distribution of manufactures by countries and divisions, the Bureau of Statistics has prepared a statement which shows for the first time the exportation of manufactures in each year, from 1790 to the present time. In 1790 the total amounted to a little over \$1,000,000 and formed 6 per cent. of the total exports; in the decade from 1791 to 1800 exports of manufactures averaged about \$2,000,000 per annum; in the decades ending with 1810 and 1820, respectively, they averaged about \$3,000,000 per annum and formed about 7 per cent. of the total exports; in the decade 1821-30 they averaged about \$6,000,000, and never reached as much as \$10,000,000 prior to 1840. By 1850 the exports of manufactures had reached \$17,500,000, and in 1860 for the first time touched the \$40,000,000 mark, but did not cross the \$50,000,000 line until 1870, when they amounted to \$68,279,764. In 1877 they for the first time crossed the \$100,000,000 line, the total for that year being \$122,577,652. In 1896 they crossed the \$200,000,000 line, the total for that year being \$228,571,178; in 1899 the total was \$339,592,146, and since 1900 the exportation of manufactures has constantly exceeded \$400,000,000 per annum.

Process of Galvanizing.

In an article in the *Journal of the Franklin Institute* Prof. W. J. Richards says that the trade name "galvanizing" relates to the coating of iron with zinc. In order to do this the iron article to be coated must first be surface cleaned from all dirt and other impurities, so as to present a perfectly clean metallic surface. If any dirt, scale or oxide remains on the surface the zinc will not adhere to that part and imperfect work will be the result. This cleaning is done by immersing the article in a bath of sulphuric acid and water, washing well in water, plunging in hydrochloric acid for a short time and drying. The article is then put into the bath of molten zinc. If sheets of similar articles that will not retain much water are being coated the drying may be dispensed with to advantage. The galvanizing tank, or bath, as it is called, is of necessary size for the articles to be submerged, varying from $\frac{1}{2}$ to 30 tons capacity.

This tank is usually oblong in shape and is divided on its surface by a longitudinal partition into two parts. On one side of the division a suitable flux is placed, which will dissolve the oxide of zinc on the surface or prevent its formation. The flux used is ammonium chloride, or, in trade parlance, sal-ammoniac. The other side of the bath is kept clean by continually skimming off the oxide of zinc as fast as it forms. In this skim-

ming of the pot considerable shot metal is unavoidably removed with the oxide.

The side with the sal-ammoniac soon becomes covered with a thick black scum which consists of the dissolved oxide, which has partly decomposed the ammonium chloride and formed a double chloride of zinc and ammonium. The sal-ammoniac must be fed continually to the top of the pot so as to keep the surface of the molten zinc clean and free from oxide, or else the oxide will adhere to the iron surface and affect injuriously the finished product by leaving spots uncoated with zinc.

By the continued addition of sal-ammoniac the scum accumulates on the top of the pot and soon gets too thick for the workman to push his plates or other articles through, so a portion is removed from time to time. This yields on one side a waste called sal-ammoniac skimmings and on the other side zinc oxide or zinc skimmings.

Yet another by-product is made that is called zinc slab dross. This is formed by the continued washing away of a portion of the iron that is being galvanized, for zinc in a molten state will alloy with iron, so that as the iron becomes as hot as the bath its surface begins to dissolve in the zinc. If from accident or design a piece of iron is left in the bath after this dissolving process commences it will in time be entirely dissolved. Bolts, nails, castings, &c., are often found in the bottom of the bath which are all, as it were, eaten away or dissolved in the zinc.

This addition of iron to the bath forms an alloy of iron and zinc that is of greater specific gravity than the zinc itself, and which falls to the bottom of the bath. If the bath is run hot it collects very fast, but under ordinary circumstances a bath of the usual size for pipes or sheets will make a ton of this dross in a week.

In order to have depth enough to do the work properly the dross must be removed. This is usually done every Saturday afternoon. A large spoon is used, perforated with holes to allow the zinc to drain out, and the semifluid dross is pasted into moulds, smoothed off with a shovel, and is then the slab dross of commerce.

Pig Iron Production for Six Months.

General Manager James M. Swank of the American Iron and Steel Association publishes in the *Bulletin* of July 28 complete statistics of the production of all kinds of pig iron in the United States in the first half of 1902. These statistics are complete, as every manufacturer of pig iron in the country, without a single exception, responded to the request for this information.

The total production of pig iron for the first six months of 1902 was 8,808,574 gross tons, against 7,674,635 in the first half of 1901 and 8,203,741 tons in the second half of 1901. This shows an increase in production in the first half of 1902 over the preceding six months of 604,833 tons. The total production of the 12 months ending June, 1902, amounted to 17,012,315 tons. It is possible that the production of the year 1902, notwithstanding the interruption caused by the anthracite strike, may exceed 18,000,000 tons. The production of pig iron by the United States in the first half of 1902 was, in round figures, 1,000,000 tons greater than the production of either Great Britain or Germany for the whole year 1901.

The production of Bessemer pig iron in the first half of 1902 was 5,105,932 gross tons, against 4,582,187 tons in the first half of 1901 and 5,014,606 tons in the second half of 1901. The production of basic pig iron in the first half of 1902 was 1,053,274 gross tons, against 645,105 tons in the first half of 1901 and 803,745 tons in the second half of 1901. The production of charcoal pig iron in the first half of 1902 was 186,098 gross tons, against 194,231 tons in the first half of 1901 and 165,916 tons in the second half of 1901. In addition there were produced in Tennessee in the first six months of this year 6004 tons of pig iron with mixed charcoal and coke.

J. D. OWENS, dealer in Hardware, Stoves, Agricultural Implements, &c., Cameron, W. Va., has removed his business to new quarters.

PATTERN FOR TIN CHURN.

A correspondent at Clarendon, Texas, asks us to publish the patterns for a 3-gallon tin churn. In Fig. 1 is given a perspective view of a churn, in which A is the body, B the inverted cone cover, C the handle of the churners and D the churners, while *a* and *b* show the perforations in the cross pieces. For the patterns for the various pieces proceed as is shown in Fig. 2, which is applicable to any size of churn. First draw the center line A B, upon which lay off the height of the churn, as shown by *n m*. Then lay off the top and bottom diameters, F E and D C respectively, and extend the sides D F and C E until they meet and intersect the center line at *b*. Now draw the bottom G, which make slightly concave, seaming it to the body at *a* and *a* and raising the bottom G on the wood block with the raising hammer. Now draw the cover H I J K in the form of an inverted

scribe arcs in X, as shown by K' J' and 1' 1". Now take the stretchout of the semicircle H 4' I, and starting at any point, as 1' on the outer arc in X, step off twice this amount, as shown from 1' to 7' to 1". From points 1' and 1" draw radial lines to *c'*, intersecting the inner arc at K' and J'. Then will K' J' 1' 1" be the pattern for the cover, with laps allowed for double seaming.

W V in diagram Y shows a perspective of one of the churners, with double edges bent at *d* and *e* to stiffen the same. Holes are punched into the top, as shown, while X is the center hole, to which the metal tube C, in Fig. 1, is fastened. A wood bottom should be fitted under the bottom G in Fig. 2 to secure stiffness.

The Proposed Tin Plate Wage Reduction.

By Monday next it will be known definitely whether the employees of the tin plate mills will accept the pro-

Fig. 1.—Perspective View of Churn.

Fig. 2.—Sectional Views and Patterns.

PATTERN FOR TIN CHURN.

cone, soldering a small tube in the center, as L M, to allow the handle S to work easily when churning. A double edge is allowed at P and R, to which the rim N O is seamed, fitting tightly into the top of the body, which is stiffened by the wire edge F E.

By making the cover in the shape of an inverted cone, any fluid which escapes while churning flows back again into the churn through the tube L M. Extend the sides of the cover I J and H K until they meet and intersect the center line at *c*. Now, with *m* and *n* as centers and radii equal respectively to *m C* and *n I*, draw the semicircles C 5 D and I 4' H, both of which divide into equal spaces, as shown respectively by points 1 to 9 and 1' to 7'. Then, with *b* as center and radii equal to *b C* and *b E*, describe the arcs C 9 and E U, and starting at any point, as 1, step off on the arc C 9 the stretchout of the semicircle D 5 C, as shown by similar figures on C 9. From 1 and 9 draw radial lines to the apex *b*, which intersect by an arc struck from *b* as center and *b E* as radius, thus locating the points T and U. Then will T U 9 1 be the half pattern for the body of the churn, to which laps are allowed for seaming and wiring, as shown.

For the pattern for the cover use *c'* in X as center, and with radii equal to *c J* and *c I* in the sectional view, de-

posed cut in wages when working on tin plate for export. The final vote will be an "aye" and "nay" one, and it is confidently stated now that the vote will be against accepting the reduction. Some lodges have voted in favor of it, but more have voted against it, and it is believed that the men will not accept the proposed cut. The officials of the Amalgamated Association favored the proposed cut and tried to get the men to accept it, but to no purpose. What action will be taken in the future by the respective parties, the American Tin Plate Company and the Amalgamated Association, remains to be seen.

WITHIN a short time everything at the Sheet plant of the Monarch Iron & Steel Company, at Parkersburg, W. Va., will be in as good as or better condition than it was before their main building was blown down recently by a storm. Work has been started on a boiler house, 38 x 53 feet, while the main building will be heavily reinforced and its strength considerably increased. The company have received the shears for the plant, and the Morgan Engineering Company, at Alliance, Ohio, will ship them a large anvil block this week weighing about 52,000 pounds.

Sheet Metal Truck.

The Fairbanks Company, 416-422 Broome street, New York, who manufacture hand trucks for handling all kinds of materials in a variety that exceeds 100 styles and patterns, have now put out the sheet metal truck here illustrated. It is designed for use in rolling mills or any place where sheet metal must be hauled about. In length the truck can be furnished from 10 to 14 feet, inclusive, 36 inches wide, with platform uniformly 23 inches high. The sheet rests on six strips of angle iron, placed longitudinally, $2\frac{1}{2} \times \frac{1}{2}$ inch in dimensions. There are three truss braces under the frame, each $1\frac{1}{4} \times \frac{3}{8}$ inch. There is one cross bar 2 inches square and six cross bars $2\frac{1}{2} \times \frac{3}{4}$ inch. Placed in the top of the platform to receive the metal sheets are 12 steel rollers, each $2 \times 8\frac{1}{2}$ inches, on which the sheets roll in the process of loading or unloading. The axles are $2\frac{1}{2}$ inches square, with heavy steel braces front and rear. The metal wheels are 21 inches in diameter, with 3-inch face, and have 14 cold drawn steel rolls in each hub, the rim of the wheels being cast iron, with wrought iron tires shrunk on and wrought iron spokes. The fifth

Sheet Metal Truck with Roller Top.

wheel is 15 inches in diameter. As the materials in this construction are entirely metallic the truck can be run into an oven with its contents if so desired.

Forest City Paints.

The Forest City Paint & Varnish Company, Cleveland, Ohio, have prepared and are distributing a new illustrated catalogue and price-list of the paints and varnishes which they manufacture. In an introductory note the company state that they use only the purest and best material in the manufacture of their goods. In the early pages attention is called to the Forest City mixed paints, which are furnished ready for use, and which are a strictly pure lead, zinc and linseed oil compound. The Forest City white lead and the Ledanoil white paint are also especially noticed. These are followed by the Forest City iron paints, adapted for use on buildings, roofs, tanks, &c. These are furnished, either in paste form or mixed ready for use, in red, black, brown, green, bright ochre and purple colors. The company also make a pure graphite paint, which can be used for similar purposes. One of the specialties of the concern is their Carbonite black elastic roof and iron paint, which is described as weather, water, rust, acid, sun and fire proof, and which can be used upon iron, steel, tin, wood, felt, tile, canvas, slate, brick or stone. They also offer a special smoke stack enamel, which is applied the same as any paint, and is claimed to be a perfect protection against rust or corrosion. The Forest City roofing cement, furnished in red, brown and black, is another product to which special attention is called. This cement, it is pointed out, is absolutely effective in stopping leaks in roofs, and for bedding and pointing slate, brick, stone, metal and wood work. It is elastic and

durable. A plumbers' soil, which is claimed to be entirely odorless and not liable to spoil, is also manufactured by the concern ready for use. The company further offer a full line of paint brushes, and everything connected with the use of paints and varnishes. Their catalogue is very tastefully gotten up, the cover bearing a design in four colors. The illustrations are all presented on special plates which bring out the half-tone engravings with good effect.

The Youngstown Iron Sheet & Tube Company.

The annual meeting of the stockholders of the Youngstown Iron Sheet & Tube Company was held in Youngstown, Ohio, last week. The stockholders were well satisfied with the report of the operations of the company submitted by James A. Campbell, general manager. The stockholders elected the old board and one additional member besides. The board as it now stands is as follows: Myron C. Wick, Robert Bentley, C. D. Hine, H. M. Garlick, William Wilkoff, James A. Campbell, H. H. Stambaugh, George L. Fordyce, all of Youngstown, and Harry Dalton, J. L. Severence and James Parmelee of Cleveland. The directors passed the election of a new president to take the place of George D. Wick, who retired when he went to Europe several months ago, deferring action on this office to a later meeting. The other officers elected were: James A. Campbell, general manager and vice-president; W. H. Foster, secre-

tary, and Richard Garlick, treasurer. It was decided to elect an Executive Board for the company, and the members to constitute this board chosen were: Robert Bentley, H. H. Stambaugh, James A. Campbell, Richard Garlick and George E. Day. The last named gentleman formerly of Casey & Day of Chicago, has also been made general sales agent. It is the intention of the company to erect a large basic open hearth steel works at Youngstown, and plans for the new works are now being prepared.

Follansbee Brothers Company.

Fallansbee Bros. Company of Pittsburgh, manufacturers of tin and terne plate and large jobbers in sheets and metal goods, have bought a tract of land at Mahan Station, on the Pittsburgh, Wheeling & Kentucky branch of the Panhandle Railroad, near Wheeling, W. Va., and will build on a part of the site a modern plant to contain four sheet and four tin mills. Contracts for much of the equipment and the building were placed some time since and the work of excavation has been finished. The new plant will be built as rapidly as possible and it is expected to be ready for operation early next year. A galvanizing works will be included. The company will manufacture black and galvanized sheets, corrugated sheets, eaves trough, siding and roofing and tin and terne plate. Follansbee Bros. Company have operated a tin plant in Allegheny, Pa., for some years, and this will be removed to the new works as soon as they are finished. The name of the station at which the new plant is located will be changed from Mahan to Follansbee. Abundant rail and river shipping facilities will be enjoyed as well as cheap coal and natural gas.

Roofing Tin.

For some time past, says the *Railway Review*, there have been frequent controversies in trade circles about the quality of terne plates (roofing tin). It is universally conceded that, all things considered, the thin sheets of iron and steel when well covered with the non-corrosive alloy of tin and lead are the most convenient and most serviceable form of roofing material. Terne plates are pliable and can be worked around sharp corners as well as on rounded or flat surfaces. The nature of the coating is such that the several plates can be seamed and soldered together into one large sheet of unbroken surface, which by means of the several seams is sufficiently flexible to allow for contraction in cold and expansion in hot weather. The rigidity and toughness of the steel, which forms the base of terne plates, makes the latter unbreakable, and yet their weight is less; and being non-combustible affords better protection against fire than any other roofing material.

These and many other merits possessed by roofing tin are conceded by everybody, but the contention is that terne plates made in recent years do not possess the same lasting qualities which in former years made this class of roofing stand without a peer in the roofing business. The blame for the alleged deterioration is generally but erroneously placed on the fact that soft steel has been substituted for wrought iron.

Before the Bessemer and open hearth or Siemens-Martin steel processes were invented the iron base of the coated sheets (commonly called "black plates") was, like all other forms or shapes of wrought or forged iron, rolled from blooms, produced in the knobbling fire or puddling furnace, but now Bessemer and open hearth soft steel are being used almost exclusively.

It seems reasonable that our steel makers did not and could not know at once for a certainty what ingredients and qualities of raw materials were required for roofing tin purposes and they may have occasionally made a miss of it; but everybody who became acquainted with the new steel process saw at once that the latter afforded far better facilities for homogeneousness and uniformity of product than the old methods. As is nearly always the case, so it is here, when people receive an inferior quality of the new product they will make comparison with the best class of material that had been made in the old way, forgetting entirely how often they had to hear complaints of various defects, such as that sheets were blistered or so brittle that they could not stand plain scaming, &c., defects which have been almost entirely eliminated by the steel process.

The nature of soft steel is, of course, different from that of wrought iron, and it must be admitted that while the advantages possessed by the substitute outnumber by far the disadvantages, some of the latter were encountered at first and it took time and study to overcome them, but that has now been successfully and completely accomplished.

At the present time a number of the great steel works, having recognized the importance of the tin roofing trade, make soft steel bars for high grade roofing tin purposes a specialty. We find that the raw iron for these bars is carefully selected, analyzed and inspected. The melting and casting of the ingots are done in a manner which eliminates or rather brings to the surface of the molten metal all the impurities that may have been contained in the raw material, and these are removed before the metal sets. As a further safeguard the top of the ingot is cropped before it is rolled into the "tin bars,"* and thus there are absolutely no impurities left in the metal that could cause disintegration from inside to out. The iron in the steel tin bar, and consequently in the black plates, is purer than it could ever be in wrought iron.

Some people have argued that the purity of the steel is the very cause of its quicker oxidation, but however that may be as regards uncoated steel goods, pure iron will not rust if it is removed absolutely from contact with the atmosphere by a covering of such non-corrosive metals as tin and lead.

It would be a strange fact indeed if in spite of all the progress that has been achieved, and in spite of all the scientific researches, we would have to go back to old and obsolete methods in order to produce good roofing tin. We now have the evidence that the once existing difficulties have been overcome and that good roofing can be obtained by those who will go to the trouble and look for it.

A coating process which will assure a thorough amalgamation of the coating mixture with the body of the plates is most essential in the production of reliable roofing tin. A careful study has revealed the fact that inferior coating methods are to blame for the production of inferior roofing tin rather than the substitution of soft steel for wrought iron.

* A steel bar rolled for tin and terne plate purposes is, in mill practice, called a tin bar.

It was unfortunate that almost simultaneously with the introduction of Bessemer and open hearth steel a number of new coating processes were tried and introduced with the view of reducing the cost of production, but the reduction if effected was in most cases at the sacrifice of quality.

At present there are yet a number of coating processes in vogue, and users of roofing tin will do well if they post themselves on the merits of the same. The United States Navy Department, which is known to be most careful in its investigations and strict in its requirements, has adopted the following in its standing specification for roofing tin:

"All roofing tin to be made of best quality soft steel as a basis.

"Coating to be thoroughly amalgamated with the black plate by the palm oil process. This coating must be applied so that the sheets be evenly and equally coated on both sides and the coating equally over each sheet. After the plate has been cleansed in a weak acid solution it is to be thoroughly washed with water, after which nothing is to be brought in contact with the black plate but pure palm oil, pure new tin and pure new lead."

Many of the leading architects are adopting the same or nearly the same specification. The amalgamation of the coating metal with the body of the black plate by means of the palm oil process (often called the "MF" method) has stood the test of time and has been found to be the most reliable.

Among the new inventions which have been made in coating methods is one which possesses real and high merit. This new method is a finishing process through which the plates pass after they come in a hot state out of the tinning pots. The treatment which the plates receive effects an instantaneous setting of the hot fluid coating while they are lying in a horizontal position in a bath of oily substance, the temperature of which is below the fusion point of the coating alloy. In this position the coating metal cannot run and must set at once uniformly all over the sheet, and the coating will be evenly thick from end to end and from side to side.

The plates receive a smooth mottled surface, free from dirty grease, clean to handle, and when finished have in addition to the metal coating a cover of transparent paint that does not interfere with the soldering qualities of the plates, but acts as additional protection against atmospheric influences. This method, when applied to plates that have been coated by the "MF" process, is an absolute insurance against corrosion.

The advocates of the restoration of the old iron base roofing tin frequently fortify their arguments by pointing out roofs which, though covered with roofing tin 25, 30 or 40 years ago, are still intact. While such is a good argument in favor of tin roofing generally it does not furnish a comparison between the lasting qualities of iron base and steel base tin roofing, for the tin roofs which wore out during the same period are not here any more, and as no record has been kept of them no one can know the proportion between long lived and short lived iron base tin roofs, and therefore these arguments are somewhat in line "with the pies that mother used to bake." On the other hand, "MF" roofing tin has been made with soft steel as a basis since 1878, and there are many roofs covered early in the eighties that still exist in good condition.

If the users of roofing tin will go to the trouble of paying close attention to the material which is put on their houses and will specify brands that bear the stamps of and are guaranteed by the manufacturers, they will find that roofing tin can be obtained which is better and will last longer than any that was made in older times, and they will also find that tin roofs are still the best house covering and being the best will be the cheapest in the long run.

Merchant & Co., Incorporated.

A new 100-page catalogue has just been issued by Merchant & Co., Incorporated, of Philadelphia, New York, Brooklyn and Chicago, covering their brass and copper specialties. It is a handy volume, 4 x 7 inches in size, and contains a number of illustrations, as well as a large amount of useful information for guidance in ordering, calculating and using their brass and copper products. In a special notice to the trade the company call attention to the fact that they carry in their Philadelphia warehouses one of the largest stocks of copper, brass, bronze, &c., and seamless and brazed tubing, sheets, rolls, rods, wire, &c., in the United States. The publication covers the entire line of copper and brass products and contains a large number of tables of weights, gauges and sizes of brass and copper sheets, tubes, wire, &c., together with other tables showing the

results of physical tests of various brass and copper products. Another useful feature of the work is rules for estimating the safe limit of bursting pressure on brass and copper tubing. Among the specialties to which attention is called is Tobin bronze, extruded metal and phosphor bronze, also copper rivets and burs, tacks and nails and perforated metals and wire cloth. At the end of the book are printed tables to find the area of circles, the decimal equivalents of sizes and the United States standard gauge for sheet and plate iron and steel, also tables of decimal equivalents in eighths, sixteenths, thirty-seconds and sixty-fourths of an inch, for use in connection with the micrometer caliper. A complete alphabetical index is a useful feature of the work.

The Pope Tin Plate Company.

The large new tin plate plant which the Pope Tin Plate Company of Pittsburgh, Pa., are erecting at Steubenville, Ohio, has been started into partial operation, seven mills being at work. The remaining five hot mills will be started in a few weeks. The new works when completed will have 12 hot mills and 5 cold rolls, with a 14-stack tin house. They will be one of the largest independent tin plate concerns in the country. The plant is controlled entirely by Pittsburgh capitalists. The main building, which has been completed, is of brick and steel construction, 65 x 460 feet in area. The cold roll mills are to be placed in tandem shape, thus considerably reducing the cost of operation and increasing the output. The entire plant will be completed during the present summer. Charles E. Pope is president of the concern and E. W. Mudge secretary and treasurer. The company's Pittsburgh office is at 421 Wood street.

FLASHINGS.

It is reported that two attempts were made to burn the plant of the American Tin Plate Company at Lisbon, Ohio, involving damage to the extent of \$1500.

THE JUNIATA STEEL & IRON COMPANY, Greencastle, Ind., expect to have their new Tin Plate plant in operation in October.

THE Pittsburgh plant of the American Tin Plate Company at New Kensington, Pa., is in full operation, but the company's Pennsylvania plant at the same place has not yet been started. A new Tin house is being built in connection with the last named works.

PRESIDENT GEORGE POWELL of the Tin Plate Workers' Protective Association, and District President George H. Barrett of the same organization, have been in Pittsburgh in conference with the district managers of the American Tin Plate Company. It is understood that the company desire to arrange for a rebate on the wage scale of their wash house employees, under the same conditions as those put before the Amalgamated Association—viz., a reduction in wages on work done on Tin Plates for export. The outcome of the conference has not been disclosed.

THE MUSKINGUM VALLEY SHEET STEEL COMPANY, Zanesville, Ohio, resumed operations last week, after a two weeks' shut down, during which a number of additions and improvements were made in the plant, which now has a capacity of about 15,000 tons of finished product a year. About 300 employees are on the pay roll of the company.

PAUL A. CONLON has removed his tinsmithing business from Holgate, Ohio, to Cass City, Mich.

THE BRISCOE MFG. COMPANY of Detroit, Mich., formerly the Detroit Galvanizing & Sheet Metal Works, purchased the property of the Detroit Electric Works, at 1427-1447 Woodward avenue. At present they occupy one-half of the building for their manufacturing purposes, but on January 1 next the concern will come into possession of the entire building, which is a three-story brick structure 120 x 320 feet.

A PATENT has been granted to Fritz O. Stromberg of Cleveland, Ohio, formerly of Braddock, Pa., for improvements in machinery for rolling Sheet metal. The purpose of the invention is to dispense with the hand

labor ordinarily employed in feeding the rolls and to substitute mechanism which will feed a Sheet or pack of Sheets and pass it continuously through and back over the rolls.

OWING to the favorable opportunity for a largely increased business, R. R. Mabie, 154 Chambers street, New York, has incorporated the contract roofing branch of his business under the title R. R. Mabie Roofing Company, in accordance with the laws of New York State, with an authorized capital of \$25,000. The company will make a specialty of Gravel, Slag, Asphalt and Tile Roofing, aiming particularly at many of the large contracts now in the market.

THE GEORGE A. HOGG IRON & STEEL FOUNDRY COMPANY of Pittsburgh, Pa., manufacturers of Rolling Mill Machinery, are equipping the annealing furnaces of the National Works of the American Tin Plate Company, at Monessen, Pa., also their United States Works at Demmler, Pa., and their American Works at Elwood, Ind., with the Freeman Furnace Charger.

THE plant of the Parkersburg Iron & Steel Company, at Parkersburg, W. Va., manufacturers of Iron and Steel Sheets, is to be much enlarged. A new annealing furnace is to be added and the rolling mill building will be considerably enlarged. Early in August the Bar mill, which has been under erection for some time, will be started. Work on the building of this Bar mill has been considerably delayed on account of difficulty in getting machinery.

THE rolling mill of the Illinois Zinc Company, La Salle, Ill., resumed operations on July 21, after a shut down for needed repairs.

M. J. HYLAND, Middletown, Conn., Gravel and Slate Roofing contractor, has recently secured a large number of important contracts, says the *Record*, including work for the Coe Brass Mfg. Company at Torrington, about 46,000 square feet of Roofing for the New England Enameling Company, the Slate Roofing of the new rectory of the Church of the Holy Trinity, and a considerable amount of new work on the buildings of the Connecticut Hospital for the Insane. Mr. Hyland has done work on these buildings for nearly 25 years past. His business is constantly increasing and he employs a large force of experienced workmen at all times.

THE WHEELING ROOFING & CORNICE COMPANY of Wheeling, W. Va., will shortly remove their plant to New Martinsburg, W. Va., where work has been begun on three buildings, including a Sheet mill and corrugating plant.

THE KESTER ELECTRIC MFG. COMPANY, 251 South Jefferson street, Chicago, Ill., have sent us circulars of their Self Fluxing Solder in wire, spools, coils, segments or drops. They also manufacture Kester's Concentrated Soldering Salts, which are used by the largest electrical manufacturing companies in electric lighting and telephone plants and by manufacturers of tinware and packers of fruit. The Salts are packed in cans of ½, 1, 5, 10, 25 and 50 pounds and barrels of 600 pounds.

THE ACME SPECIALTY COMPANY have removed to their new quarters, 26 East Pearl street, Cincinnati, Ohio, where they enjoy greatly enlarged facilities, with their capacity for output more than doubled. The company are now in a position to take care of all kinds of special Sheet Metal Work, including stamping and press work.

THE GARRY IRON & STEEL COMPANY, Cleveland, Ohio, are furnishing the structural material for four large buildings to be erected by the Atlanta Tin Plate Company, Atlanta, Ind., who are installing a rolling mill at that place.

The industrial school which is being erected on Ninth avenue, Homestead, by Charles M. Schwab, president of the United States Steel Corporation, is nearing completion and arrangements are being made to dedicate the school in September. The building has been in course of erection for more than a year, and when completed will have cost about \$100,000. It is built of buff brick, with Cleveland sandstone trimmings. C. M. Schwab will attend the dedication, and President Roosevelt has also been invited to be present.

Another Aluminum Solder.

William H. Whitney of Worcester, Mass., Clark University's expert instrument maker, has found what is claimed to be a perfect solder for aluminum. He keeps the composition of the flux and the liquid with which the surfaces of the metal are cleansed preparatory to soldering a secret, and will immediately take out a patent upon his discovery. The savants of the university assert that the solder withstands tests made to demonstrate its weakness if any exists. It is even claimed that the solder has the same strength as the metal itself. Mr. Whitney has used the solder extensively in instruments of which aluminum is an important feature, especially in connecting sections of aluminum wire.

TRADE NOTES.

W. N. BOWLER, president of the Forest City Paint & Varnish Company, Cleveland, Ohio, has been elected a member of the Executive Committee of the Wholesale Merchants' Board of the Cleveland Chamber of Commerce.

SCHNEIDER'S BRAZING AND SOLDERING FLUX is the subject of a leaflet sent out by the manufacturer, Emil Schneider, 298-306 South street, Newark, N. J. This Flux is described as an antiborax adapted for brazing and for soldering gold, silver, copper, brass and steel. Among the advantages claimed for it is the fact that the solder flows more freely and does not raise or boil up as when using borax, thus making clean, neat work. It is also said to make a firm and smooth joint, free from pin holes, and the additional assertion is made that 1 pound of flux will go as far as 5 pounds of borax. For soldering it is necessary simply to dilute the Flux with water, while for brazing it should be mixed with spelter and moistened with water.

THE R. D. SWISHER MFG. COMPANY, 152-154 Fifth avenue, Chicago, are sending out a 48-page catalogue and price-list of their Rubber Stamps for all purposes.

THE EUREKA FOUNDRY COMPANY of Chattanooga, Tenn., have been incorporated with a capital stock of \$25,000 by John Stagnier, Leo Strahle, G. B. Fletcher, B. R. Hodge and W. W. Delaney, to manufacture Iron and Brass Products, &c. An old foundry building is being remodeled and equipped with new machinery for the purpose.

THE AMERICAN ASBESTOS COMPANY of Bedford City, Va., have been organized with a capital stock of \$1,000,000 to mine and manufacture Asbestos. The officers are: William C. Doak, president; Alvin N. Higgin, vice-president, and Gustave A. Conzman, secretary, all of Terre Haute, Ind.

THE erection of the factory of the New England Enameling Company, at South Farms, Conn., is being pushed as rapidly as possible in order that it may be completed by September 1. It will be one of the best plants of its kind in the country.

THE Brass foundry of the Charles Parker Company, Meriden, Conn., was totally destroyed by fire recently.

THE EDWARD LITTLE COMPANY of New York City have been incorporated with a capital stock of \$2000 for the manufacture of Stamped Galvanized Ware. E. H. Little, A. W. Little and E. Little are the incorporators.

THE RUSSIAN CEMENT COMPANY, Gloucester, Mass., are distributing their price-list No. 16, illustrating Le Page's Liquid Glue, Mucilage, Cement and Library Paste.

THE AVERY STAMPING COMPANY, Cleveland, Ohio, are distributing what they term Ping Pong blotters, which show attractive pictures of the beasts of the wood playing the popular game. For rackets the Never-Break Spiders and Griddles are used, the netting being made of a row of Never-Break Kettles and Scotch Bowls.

THE S. M. HOWES COMPANY, 42-46 Union street, Boston, Mass., are manufacturing a line of French Folding Screens for fire places which are finished in pure brass, gilt, lacquer and Berlin black. They are made in a large variety of styles and in various heights. The company state that they are the only manufacturers of this line

in the United States and that their Screens are heavier, smoother finished and generally better than the imported articles. Their line of Screens are shown in connection with a variety of fire place goods made of brass, wrought iron and cast iron, and in the same catalogue which is ready for distribution. The catalogue shows a large variety of Basket Grates, Andirons, Fire Sets, Fenders, Bellows, Brushes, &c.

THE BOSTON BELTING COMPANY of Boston and New York are sending out a folder illustrating their Rubber Lined Cotton Mill Hose, also Unlined Linen Hose, for fire protection, with a description and price-list on each of these lines of goods.

THE NORTON EMERY WHEEL COMPANY of Worcester, Mass., are erecting a new shop at Barbers' Crossing, 80 x 152 feet, with a gallery on either side and at the north end of the building. In one of these galleries will be manufactured the small parts of their machines, and the other side will be devoted to commercial grinding. The main floor will be used for erecting purposes. The shop is equipped with a 10-ton electric crane and a number of electric motors. This shop is to be devoted exclusively to the manufacture of special Norton Grinding Machines for cylindrical work. Machines of this character are in growing demand, both in this country and in Europe.

WATERBURY BRASS COMPANY, Waterbury, Conn., and 130 Centre street, New York, are getting out an exceptionally complete catalogue relating to the large line of Brass and Copper and related products of which they are manufacturers. It will also contain rules and formulae and tables and other matter, which will thus be presented in a convenient form for reference. They are now receiving applications from parties who desire to be placed on the mailing list, to whom a copy will be sent as soon as the catalogue is issued.

A PAMPHLET has been prepared by the Monarch Smoke Preventer Company of Cincinnati dealing with their method of smoke prevention. It is stated that with this system any kind of coal can be used and increased boiler efficiency results.

THE OIL FILTER AND PURIFIER, made by the Burt Mfg. Company of Akron, Ohio, is covered in a recent pamphlet. This company have been making Oil Filters for 12 years past, and during that time have made and tested every kind of device for this purpose.

P. M. SHARPLES, West Chester, Pa., manufacturer of Cream Separators and Dairy Appliances, is enlarging his plant to nearly double the present capacity. The improvements consist of an extensive addition to the foundry and an addition, 50 x 350 feet, to the machine shops, the latter just completed. Mr. Sharples advises us that he had to refuse orders for a large number of Cream Separators this season because he could not supply them.

THE PORTER METAL WORKS, San Francisco, Cal., have added to their galvanizing plant a complete plant for tinning by the dipping process, and are now in a position to handle anything in the galvanizing and tinning line.

THE BLACK SILK STOVE POLISH WORKS, Lewis D. Wynn, proprietor, Sterling, Ill., advise us that their Black Silk Polish has now been on the market for 16 years without any change in name or keeping qualities, the claim being made that it will withstand any climate from three to five years without drying out. The ease and cleanliness of its application and the brilliant luster of the Polish are also pointed out. The company refer to the demand, both domestic and foreign, as ever increasing.

AYLING BROTHERS, 8 to 14 Haddon avenue, Chicago, are calling the attention of the trade to their newly patented A. B. Stove Polish, prepared in a powdered form, which is readily mixed and is claimed to give a quick and brilliant black water proof polish to the stove.

The meeting of the International Sanitary Congress, that was scheduled for opening in Washington, D. C., on October 15, has been postponed to December 2, in order to accommodate foreign delegates who desire to attend the meeting of the American Public Health Association, to be held in New Orleans, La., on December 8.

THE LETTER BOX.

Inquiries in regard to practical questions of general interest are invited, in reply to which we shall be glad to receive suggestions and information from our readers.

Correspondents are requested in all cases to give their names and addresses, which will not, however, be published or disclosed without their consent.

PATTERNS FOR A CHIMNEY TOP.

From J. L., New Brighton, S. I.—Will *The Metal Worker* please explain how to lay out the patters for a chimney top, as shown by the sketch which is sent herewith?

Answer.—The perspective view, Fig. 1, is a reproduction of our correspondent's sketch. To this we have added the orthographic projections, Fig. 2, in which the plan view is shown through A B in the elevation. The only development required for the chimney top is the hood, while the other pieces are round disks and oblong

Fig. 1.—Reproduction of Correspondent's Sketch.

Fig. 3.—View of Construction.

Fig. 2.—Plan, Elevation and Pattern.

PATTERNS FOR A CHIMNEY TOP.

pieces of metal. Thus, in Fig. 2, C D E F is the plan view of the pipe shown in elevation by H I J K. L M N O in plan shows the disk, shown in elevation by S T, and C D E F L M N O shows the circular ring shown in elevation by P H I R. These two patterns are obtained directly from the plan. a, b, c and d are the inner vertical louvers, while e, f, h and i are the outer vertical louvers, set in such a position on the upper and lower disks as to leave an opening for the escape of the smoke, which at the same time will keep the wind from causing a down draft. The escape of the smoke is indicated by the arrows.

The patters for the vertical louvers are as wide as the stretchout of a or e in plan, and as high as shown in the elevation from P to S, with laps allowed for riveting, as shown at i and d in the plan. The pattern for the hood is obtained in the usual manner. With U as center and U S as radius describe the arc S W, upon which place the stretchout of twice the amount of spaces contained in the quarter plan V N O, as shown by the small figures 1 to 5 to 1 on S X W. Draw a line from W to U and allow laps as shown by the dotted lines. Then will S U W X be the half pattern for the hood. This completes all of the patterns required.

The method of construction is shown in Fig. 3. A represents the hood, double-seamed to the disk D at E.

B shows the vertical louver, riveted to the disk D at the top at A, before the disk is double-seamed to the hood, and riveted to the disk F at the bottom at b. C shows the pipe with a bead, e, run through the same, on the beading machine, within $\frac{3}{4}$ inch from the edge m. The edge is then notched, the round ring F pressed tightly against the bead e, and the notched lap m turned over as shown at e, which completes the construction.

ARCHITECTS AND THE ROOFING QUESTION.

From F. K. T., Raleigh, N. C.—I cannot agree with "J. L." of Peterstown, W. Va., whose letter appeared in *The Metal Worker* of June 21, that architects pay too little attention to the roofs of the buildings they design. If the foundation is the most important part of the building structurally, so is the roof of the modern residence the most important feature architecturally. The roof is designed to fit the house, not the house to fit the roof. If the latter was the case it would be an easy matter to carry the roof water to the rear of the building and do away with "J. L.'s" water barrel, which he seems to think an unavoidable necessity.

I do agree, however, with "J. L." that more judgment might be used in locating the leaders from the roof, particularly in residence work. I have seen leaders fastened to the face of an Ionic veranda column, when they could just as well be run in the angle against the main building and thus have been comparatively out of sight. The wrong location of the leaders may have been the fault of the tinner, in which case it could be easily remedied. Such mistakes can be avoided if the architect in making his roof plan will mark on it the location of the necessary leaders and see that they are run in the positions indicated.

A residence with all main roof surfaces of equal pitch gives the best appearance, consequently the rain water will be more or less conveniently distributed to the front or sides, depending on the shape of the building. If the structure is large the water cannot be carried for too great a distance. It is generally possible, however, to grade gutters so that leaders can be run in angles of the building or in positions least exposed to sight. If this cannot be done a twisted polygon or corrugated leader, with ornamental conductor head and shoe, can be made to add rather than detract from the appearance of the building.

From T. B. G., Baltimore, Md.—A correspondent, "J. L." in *The Metal Worker* of June 21, calls attention, under the above caption, to the fact that some roofs are so badly designed as to throw most of the water to the front of the house. I do not understand why, if such is the case, provision cannot be made for leading the water away instead of collecting it in the primitive manner mentioned. In my own practice as an architect I have never seen the hogshead or barrel system resorted to in either country or suburban work. It may be true that, considering the multiplicity of more important matters, architects are sometimes careless in this particular, but I am quite sure that with a little study the spouter could generally so arrange matters as to lead the water to a more sightly and convenient place than the front. I beg the correspondent to carefully consider the next piece of work of the kind that comes into his hands and see if he cannot devise some scheme to obviate the difficulty.

PATTERN FOR TRANSITION PIECE.

From T. J. W., Jersey City, N. J.—I should be greatly obliged if *The Metal Worker* would show me how to get out the patters for the piece of work of which I inclose a sketch.

Answer.—Our correspondent will find the method of describing patterns for a transition piece round at the top and oblong at the bottom, such as is shown in the sketch submitted by him, in Problem No. 188 of "The New Metal Worker Pattern Book."

BOILER TOO LOW.

From B. K. M., Torrington, Conn.—I have a problem in boiler and range connection upon which I would like the opinion of *The Metal Worker* and its expert readers. There is a steel range of the hotel type with two fire boxes and two water backs, each connected separately with a boiler. Fig. 1 is a plan showing the arrangement, and Fig. 2 is an elevation showing the pipe connections. The trouble is that there is an almost continual snapping, cracking and pounding noise going on in the boiler, more especially in the 80-gallon boiler, whenever the range is in use. Sometimes the sounds follow each other in rapid succession, and then again somewhat slower, and they are very annoying and disturbing, as they are so loud as to be heard over a considerable portion of the building and for quite a distance out into the yard. By drawing off large quantities of hot water temporary relief is afforded, but it lasts but a short time, when the noise continues as before. The piping and connections have been changed very recently from $\frac{3}{4}$ to 1 inch pipe, and the boiler taken out and cleaned, while the water back is new. All this has had no effect upon the noise, which continues just the same as with the old water back and the $\frac{3}{4}$ -inch pipe. The boilers are set low on account of low ceilings, so that the bottom of the lower one is about 17 inches lower than the level of the water back. There is a rise of about 1 inch from the water back to the hot water connection on the side of the boiler. From this explanation the situation may be understood, and I hope that some satisfactory solution of the problem will be presented, for it certainly will be welcome.

Note.—We shall be glad to have the views of our readers on this subject. In our opinion there is but little doubt that the trouble is largely due to the fact that the bottom of the boiler is so much below the water back, and that there is so small a rise from the water back to the side connection of the boiler. This impedes circulation and facilitates the generation of steam in the water back, which causes the noise when the steam condenses, whether it be in the piping or in the boiler. If there is no way of raising the boiler, benefit will be de-

Boiler Too Low.

rived from continuing the hot water pipe from the water back up to the top of the boiler and connecting it with the hot water service outlet. This should be done by removing the brass coupling and screwing a 1-inch iron pipe nipple in its place, and then a tee, the side of the tee to receive the hot water pipe from the water back, and the other opening to receive the hot water service pipe. It would also seem that the water back is larger than is needed for the work, as the fire is run, and that if a smaller water back was used, or a fire brick placed in front of the water back now in use, steam generation in the water back would be largely avoided.

WHO MAKES THE EPPLY GUTTER BEADER?

From Carter, Donlevy & Co., Philadelphia, Pa.—Can you or any of the readers of *The Metal Worker* tell us who makes the Epply gutter beader? This is a machine made years ago for forming independent beads.

It was produced in York, Pa. We are unable to locate the present maker.

A ROOF AROUND A TREE.

From J. M., Washington, D. C.—I need information as to what is the best way to make an almost flat roof tight around an oak tree, about 12 inches in diameter where it comes through the roof. The following points, and perhaps some others, should be considered when making recommendations, namely: Health of tree, growth of tree, vibration of tree, heating of room through which the tree runs and that mosquitoes must

A Roof Around a Tree.

be kept out of the room. The roof is about 10 feet from the ground and will be flat seamed. I propose to make a water cup joint flashing, as shown in the accompanying sketch. The upper portion of the flashing will be in two parts, well lapped, and will have a band and draw bolts around the top to hold it suspended in the water cup.

Note.—This is an interesting and rather unusual question, and we hope that some of our readers who may have had experience of this kind of work will lend their aid to our correspondent.

PATTERN FOR BATHTUB.

From F. M., Petrolia, Canada.—I should like to find out through *The Metal Worker* how to lay out a pattern for a plunge bath which has a flow of 2 inches from the head to the foot and has more of a flare on the end than on the side. I inclose herewith a sketch showing the style of tub that I want to construct.

Answer.—If this correspondent will follow the principles shown in Problem No. 197 in "The New Metal Worker Pattern Book," he should have no difficulty in constructing the patterns for the bathtub shown in the sketch submitted by him.

Fires Caused by Electric Lights.

Although electric wiring, through being defective, is often the cause of fires, says *Fire and Water*, yet it may be that it is not unfrequently made a scapegoat for the carelessness of those who place inflammable goods and stuff too near incandescent electric light bulbs. It is a mistake to rely too entirely upon that method of lighting as being nearly absolutely safe—as great a mistake as to imagine that these bulbs give out small quantities of heat. An electrical expert says that "measurements show that of the energy of the current only 6 per cent. is turned into light; the other 94 per cent. manifests itself as heat. Inflammable substances near incandescent lamps are readily ignited. If a 16 candle-power lamp lighted by a current of 100 volts is immersed in a vessel containing 300 grams (10½ ounces) of water it will bring the water to boiling point in an hour. Celluloid near such a lamp is inflamed in five minutes. These and other experiments of the sort direct attention to the necessity of care even with electric light." The above statement tends to show that many of the fires that start in show windows lit by incandescent lamps are traceable, not to defective wiring, but to the abnormal heat generated by the electric light itself.

TRADE REPORT.

MARKET SUMMARY.

Pig Tin is dull and unchanged.
Copper is in light demand and without change in price.
Pig Lead is dull and firm.
Spelter continues scarce and strong, with tame demand.
Antimony is quiet and a shade lower in price.
Nickel is in fair demand and slightly lower in large lots.
Aluminum is firm and in good demand.
Tin Plates are very quiet and unchanged in price.
Black Sheets of the heavier gauges are in good demand, but Light Sheets are quiet; prices in the latter are softer.
Galvanized Sheets are quiet and unchanged.
Old Metals show no change.
Foundry Iron is very scarce and prices nominal.
Sheet Copper is in fair demand and firm in price.
Sheet Zinc is firm; demand is moderately active.
Hardware is seasonably quiet, with prices strong in nearly all lines.
Cast Iron Soil Pipe and Fittings, 4-inch and Extra Heavy, are scarce and in active demand; prices are higher.
Tarred Roofing is very active and strong.
Eave Trough and Conductor Pipe prices have been reduced 5 per cent.
Cast Iron Hollow Ware prices have been marked up.
Pitcher Spout Pumps are higher in price.
Wire Nails are quiet, with retail prices rather more soft.
Cut Nail prices have been reaffirmed for August; demand is moderate.
Window Glass is quiet and unchanged.
Linseed Oil is moderately active and firm.
Spirits Turpentine is quiet and $\frac{1}{2}$ c. lower.
Old Rubber is fairly active and prices are firmer.

METAL MARKET.

NEW YORK, August 1, 1902.

Pig Tin.—In sympathy with the London market, prices of Tin declined somewhat in the early part of the week. On Thursday, however, a stronger tone developed both here and in London, and prices returned to about the level ruling at the date of our last report; consequently, jobbers' quotations are unchanged. Straits Pig in small lots is quoted 29 $\frac{1}{4}$ c. to 29 $\frac{3}{4}$ c. per lb. Business has been extremely dull, this dullness being even more pronounced than is customary at this time of year. Importations of Tin at Atlantic ports during the month of July amounted to 2352 tons. Afloats now aggregate 3015 tons, of which more than one-half is expected to arrive within the next ten days. A scarcity of the metal here is not feared, therefore, and consumers are resting easily regarding future supplies and are awaiting a lower market before making large purchases.

Copper.—The position of Copper is entirely unchanged. The market presents a very tame appearance, the demand being of the lightest character. Prices, which remain on the level of a week ago, are still considered to be in buyers' favor. Even in a speculative way, the market has been inactive. Jobbers quote Lake Ingot in small lots at 13c. per lb., and Casting Copper at 12 $\frac{1}{2}$ c. to 12 $\frac{3}{4}$ c.

Sheet Copper.—The demand for Sheet Copper continues of fairly good proportions and prices remain firm on the basis of 18c. per lb. from store.

Pig Lead.—The market here is entirely without change. Demand is slow, as is customary at this season of the year, and prices are firm. American Pig in small lots is quoted at 4.45c. to 4 $\frac{1}{2}$ c. per lb. St. Louis advices report firm conditions ruling in the Lead mar-

ket at that point, with the quantity and quality of demand showing some improvement.

Spelter.—The market for Spelter remains firm. Spot is still very scarce and strong in price. The demand from all sources is comparatively small, otherwise spot prices would be materially higher than they are at the present time. Good Western brands in small lots are quoted by jobbers at 6c. to 6 $\frac{1}{2}$ c. per lb. St. Louis advices report that after a slight recession in the past week the Spelter market has strengthened, and a heavy demand has developed. Spot metal is very scarce and brings the highest price. The feeling of the trade seems to presage high prices for Spelter for some time to come.

Antimony.—This metal has again declined a shade, and the market is very quiet. Hallett's in small lots is quoted at 8 $\frac{3}{4}$ c. to 8 $\frac{1}{2}$ c., and Cookson's at 10 $\frac{1}{2}$ c. to 10 $\frac{3}{4}$ c.

Nickel.—This metal has declined somewhat, so far as wholesale prices are concerned, but small lots are quoted at from about 55c. to as high as 60c. per lb.

Aluminum.—The demand for Aluminum continues active and prices are without change. Small lots of No. 1 Ingot, guaranteed 99 per cent. pure, are quoted at 37c. per lb. and 100-lb. lots at 35c.

Tin Plates.—The market for Tin Plates is unchanged. The demand is slow and jobbers' prices continue at about the figures quoted for some time past. The American Tin Plate Company are now quoting for delivery up to the end of October at the figures now ruling—viz., a basis of \$4.19 per box of Standard 100-lb. Cokes. A number of the Tin Plate mills have been shut down, or are about to be shut down, presumably on account of lack of business. It is understood that stocks at mills are piling up to a considerable extent. Jobbers are quoting American Bessemer Coke Plates, 1C, 14 x 20, in moderate sized lots, delivered at New York and corresponding points at about \$4.70 to \$4.90 per box. Cable advices report the Welsh Tin Plate industry in a depressed condition. A further decline of 1 $\frac{1}{2}$ d. per box in the price of Welsh Plates was reported this week, the quotation now being 13s. 3d., f.o.b. Swansea.

Sheets.—A continued heavy demand is noted for the heavier gauges of Sheets, but the lighter gauges are very quiet. The tone of the market on these goods is weak. Prices of Galvanized Sheets are weaker than on Black. It is claimed that the Sheet mills that do not have their own supply of Steel and have to pay market prices for Sheet Bars and Spelter cannot sell Galvanized Sheets at present prices to make a profit. Stocks of both Black and Galvanized Sheets in jobbers' hands are reported to be increasing, as well as those at the mills. Some of the Independent Sheet mills are now quoting Galvanized Sheets at net prices, which has been the policy of the leading Sheet interest for some time. A majority of the jobbers are also selling Galvanized at net prices. No. 27 One Pass Cold Rolled Soft Steel Sheets in small lots are quoted at about 3.70c. and Galvanized at 4c. to 4.10c.

Chicago advices are as follows: The demand for Heavy Sheets has continued on a liberal scale and the market is very strong. Even Light Sheets have been less pressed for sale and Galvanized Sheets have been quiet without essential change in prices. No. 27 Black Sheets in small lots from store are quoted at 3.45c. to 3.55c. and Galvanized Sheets at 4.70c. to 4.75c. for No. 27.

Old Metals.—There has been no change in the general condition of the market for Scrap Metals. Scrap Iron is moving in fair volume, but other kinds of Old Metals are rather quiet. Prices are without quotable change. Dealers are paying about the following rates for moderate sized lots, delivered at New York or corresponding points:

Heavy Copper.....	per lb. 10 c.
Light and Tinned Copper.....	per lb. 9 c.
Heavy Brass.....	per lb. 8 c.

Light Brass.....	per lb.	6 1/2c.
Lead.....	per lb.	3 5/8c.
Tea Lead.....	per lb.	3 c.
Zinc.....	per lb.	3 1/4c.
Pure Aluminum Sheet.....	per lb.	22 c.
Cast Aluminum.....	per lb.	17 c.
No. 1 Pewter.....	per lb.	18 c.
No. 2 Pewter.....	per lb.	9 c.
Tin Plate Scrap, per gross ton.....		to \$5.00
Wrought Iron Scrap, per gross ton.....		\$13.00 to 13.50
Heavy Cast Scrap, per gross ton.....		12.00 to 12.50
Stove Plate Scrap, per gross ton.....		8.50 to 9.00
Burnt Iron, per gross ton.....		7.00 to 7.25

THE PIG IRON MARKET.

NEW YORK.—Practically no domestic Iron is available for the use of Eastern foundrymen, who are in need of stock. Sales of foreign Iron are therefore increasing, and importations are now being made to meet the sharp demand for prompt delivery, dealers taking their chances of selling a shipment to needy consumers before it arrives or shortly after it is landed on the dock. Foreign Iron is now setting the pace for any business requiring delivery this year. Prices realized are from \$22 to \$25, ex-ship, according to grade and time of delivery, the higher quotation being easily obtained for spot Iron, which can be delivered at once. Consumers are freely contracting for domestic Iron for delivery in 1903, and are apparently actuated by a determination to order enough to cover their requirements, as they are frequently taking double the quantity they usually buy at one time. It is believed that even if the miners' strike ends within the coming month the Eastern furnaces will not be able to attain their normal rate of production until well toward the end of September. For delivery in 1903 the following quotations are made: Northern Iron, at tidewater, No. IX, \$22.75 to \$24.75; No. 2 X, \$21.75 to \$22.75; No. 2 Plain, \$20.75 to \$21.75. Tennessee and Alabama brands, in New York and vicinity, No. 1 Foundry, \$22 to \$23; No. 2 Foundry, \$21.25 to \$22; No. 3 Foundry, \$20.75 to \$21.25.

CHICAGO.—While there have been fewer large individual sales, the demand for Pig Iron has continued active, with some evidence that the buying movement is broadening, the smaller consumers being ready and willing to place orders for next year's delivery. Very little spot Iron is available from furnaces, most of the spot Iron offered and sold being resales. There continues to be a very narrow margin between the grades of Iron wanted for urgent delivery. In a number of cases No. 2 and No. 1 Foundry are selling at the same price. The Southern producers continue to sell mainly on the basis of \$17 for No. 2 Foundry, Birmingham, all business being taken at the furnaces. The following prices are revised to conform to the character of the business now being negotiated, of which nine-tenths, perhaps, is for next year's delivery. Premiums of \$2 to \$3 per ton are being obtained on contracts for the current year, and premiums of \$5 to \$6 per ton are being obtained for spot delivery. The following are the prices current for delivery the first six months of 1903:

Lake Superior Charcoal.....	\$25.00 to \$26.00
Local Coke Foundry, No. 1.....	21.50 to 22.00
Local Coke Foundry, No. 2.....	21.00 to 21.50
Local Coke Foundry, No. 3.....	20.50 to 21.00
Local Scotch, No. 1.....	22.00 to 22.50
Ohio Strong Softeners, No. 1.....	24.00 to 24.50
Southern Silvery, according to Silicon.....	24.65 to 25.15
Southern Coke, No. 1.....	21.40 to 21.90
Southern Coke, No. 2.....	20.65 to 21.15
Southern Coke, No. 3.....	20.15 to 20.65
Southern Coke, No. 1 Soft.....	21.15 to 21.65
Southern Coke, No. 2 Soft.....	20.65 to 21.15

PHILADELPHIA.—There is little or no difference in the condition of the Pig Iron market to-day from that of a week ago. As regards the immediate situation, it may be said that there is enough Iron to go around, but the difficulty is to find the kind required. There is not enough of the Foundry grades, consequently these command better prices than they would if the furnaces were supplied with their usual fuel. Neither are imported Irons precisely what are wanted. Prices naturally are very irregular. The following quotations represent city or nearby deliveries during the last quarter of this year and the first half of next year, with a premium of 50c. to \$1 on August and September shipments:

No. 1 X Foundry.....	\$23.50 to \$24.50
No. 2 X Foundry.....	22.00 to 22.50
No. 2 Plain.....	21.00 to 22.00

PITTSBURGH.—Large contracts for Bessemer Iron for deliveries running all through next year have been made

during the past week. The price of \$18 at furnace for shipments of Bessemer through all of next year is regarded as a very fair one to both buyer and seller. It is a low price for the first quarter, but the price of Iron may be under \$18 before the end of next year. There have been heavy sales of No. 2 Foundry for shipment through the first half of next year at \$21.50, Pittsburgh. The Southern furnaces, which now have a pooling arrangement, have fixed the price of No. 2 at \$17, Birmingham, which, with the freight to Pittsburgh of \$4.15, makes the price of Southern No. 2 Foundry \$21.15 delivered here. No. 2 Foundry for shipment this side of January is quoted at \$22 to \$22.50, Pittsburgh.

CINCINNATI.—An unusually heavy week's business in next year's delivery has been done. Quite a number of Southern furnaces are found to be sold up for the first three months of 1903. Some of the Southern furnaces announce that, from now on, all Iron sold for the second quarter of 1903 must be on the basis of \$17.50, Birmingham, for No. 2 Foundry, this being an advance of 50c. over association prices of a week ago. The situation, however, for next year's delivery is just as it has been. Sellers who happen to have a few carloads of Foundry Iron have a dozen buyers in line in anticipation of the favor. We quote, f.o.b. Cincinnati, for 1902 delivery as follows, this year's delivery:

Southern Coke, No. 1.....	\$21.25 to \$22.25
Southern Coke, No. 2.....	20.75 to 21.75
Southern Coke, No. 3.....	20.25 to 21.25
Southern Coke, No. 4.....	19.75 to 20.75
Southern Coke, No. 1 Soft.....	21.25 to 22.25
Southern Coke, No. 2 Soft.....	20.75 to 21.75
Ohio Silvery, No. 1.....	25.85 to 26.10
Ohio Silvery, No. 2.....	25.35 to 25.85
Lake Superior Coke, No. 1.....	25.35 to 26.10
Lake Superior Coke, No. 2.....	25.10 to 25.60
Lake Superior Coke, No. 3.....	24.85 to 25.10

ST. LOUIS.—So far as new inquiry and demand for Pig Iron is concerned, these are quiet days. The bulk of the demand continues to come from parties whose requirements are covered in contracts, but on account of delayed delivery are compelled to pick up odd offerings in the open market. The furnaces seem to be very careful and conservative in booking orders for 1903 delivery and few orders are accepted by sales agents before first being submitted to the furnace managers. The following is the range of prices current for cash, f.o.b. St. Louis:

Southern, No. 1 Foundry.....	\$20.50 to \$23.50
Southern, No. 2 Foundry.....	20.75 to 22.75
Southern, No. 3 Foundry.....	20.25 to 22.25
Southern, No. 4 Foundry.....	19.75 to 21.75
No. 1 Soft.....	21.25 to 23.25
No. 2 Soft.....	20.75 to 22.75

CHICAGO REPORT.

Scrap Iron and Steel.—The market continues to harden, with moderate offerings and a good demand. In carload lots any one kind of Scrap would bring an advance over quotations, but for mixed lots of Country Scrap the following prices are paid by dealers:

	Per net ton.
Country Wrought Scrap.....	\$14.50 to \$15.00
Machinery Cast.....	to 13.50
Malleable Cast.....	12.00 to 13.00
Stove Plate (free from burnt).....	9.50 to 10.00
Burnt Iron and Grate Bars.....	8.00 to 9.00
Sheet Iron and Hoops.....	8.00 to 9.00
Plow Steel.....	12.00 to 13.00
Breaking Stock.....	to 11.00
Old Boilers—whole (Iron).....	9.50 to 10.00
Old Boilers (Iron) cut in single Sheets and Rings.....	12.50 to 13.00
Old Gas Pipe and Boiler Tubes.....	12.50 to 13.00
Cast Borings.....	8.50 to 9.00
Turnings.....	12.00 to 12.50
Horseshoes.....	14.00 to 14.50

Old Metals.—The market for Scrap Copper and Brass has shown but little, if any, improvement, yet prices have been well sustained. Zinc has continued firm, dealers being ready buyers at our quotations. The following prices are being paid by dealers in this market:

	Per lb.
Copper Wire and Heavy.....	10 1/2c.
Copper Bottoms.....	9 1/2c.
Copper Clips.....	10 1/4c.
Red Brass.....	10 1/2c.
Yellow Brass.....	8 1/4c.
Red Brass Borings.....	9 1/2c.
Yellow Brass Borings.....	7 1/2c.
Light Brass.....	6 1/2c.
Pipe Lead.....	3.70c.
Tea Lead.....	3.35c.
Zinc.....	3.35c.
Tin Foll.....	21 c.
Pewter, No. 1.....	18 c.
Pewter, No. 2.....	11 c.
Aluminum.....	20 c.

Old Rubber.—The offerings have not been large, and with a fair outlet the market has remained steady. Prices paid by dealers are as follows:

	Per net ton.	Per lb.
Garden Hose.....	\$25.00
Air Brake Hose.....	45.00
Rubber Shoes.....	7 c.
Rubber Car Springs.....	5 c.
Inside Bicycle Tubing.....	22 c.
Outside Tubing.....	5¾c.
Black Rubber.....	4 c.
White Rubber.....	8½c.

Rags.—The offerings have been less liberal and the market has continued to improve, but not enough to warrant any advance in prices. Dealers continue to buy liberal offerings at 65c. to 75c. per 100 lbs., Chicago delivery.

Anthracite Coal.—The situation has shown no improvement. The demand for current delivery is light and stocks, while declining, are ample. The movement on contracts has continued moderate. On August 1 the discount will be reduced to 10c. per ton. Following are the prices current, subject to a discount of 20c. for shipment made during July:

	Grate.	Egg and Stove.
Chicago	\$5.75	\$6.00
Milwaukee, Wis.....	5.75	6.00
St. Louis.....	6.20	6.45
Kansas City, Mo.....	8.25	8.50

THE HARDWARE TRADE.

Notwithstanding the general agreement that business promises well, there is only a moderate activity in the market at this time. This is principally on account of the time of year, as summer influences and the vacation season have a marked effect. In view of the pressure of business during the six months past there is evidently on the part of both merchants and manufacturers a desire to avail themselves of at least a brief period of relaxation, and the success which has generally rewarded their operations encourages this disposition. A remarkable feature of the situation at this time is the unusually small stocks of goods which are in the manufacturers' warehouses. Not for years has the fall season been approached with such light and broken assortments. Many factories are still at work on orders taken months ago, and throughout the trade there is much correspondence in the way of hurrying shipments or explaining the delay in making them. This state of things, connected with the high prices of the raw material and the difficulty in obtaining it in certain lines, tends to keep the market steady and to give it even a strong tone. A few lines, owing to exceptional influences, are regarded with suspicion and give perhaps evidence of a slight weakness, but many others have an upward tendency. In several kinds of goods it seems not unlikely that there will be a scarcity. Manufacturers generally recognize the opportunity which this state of things affords them and are obtaining good prices and refraining from contracting ahead except in a conservative way.

NOTES ON PRICES.

Cast Iron Soil Pipe and Fittings.—The manufacturers of Cast Iron Soil Pipe and Fittings are still considerably behind with their orders, and present indications are that it will be a long time before they are able to get abreast of the current business. The principal items which are reported as being scarce are 4-inch Standard Soil Pipe and 4-inch Extra Heavy Soil Pipe, the demand for which is far in excess of the production. The 4-inch Fittings, Standard and Extra Heavy, are also reported as being very scarce. The local foundries are practically snowed under with business and there is no telling when deliveries of 4-inch Pipe and Fittings can be made by these plants. The only 4-inch Pipe coming into the New York market at the present time reaches here from Southern foundries, and this is the first time within two years that any of the Southern plants have been able to reach out to the New York market. This size of Pipe and Fittings is commanding a premium upon the manufacturers' selling price to the jobbers', this being readily paid in order to obtain the necessary

Pipe to tide over until the goods contracted for with the local foundries can be procured. The following notice has been sent out by the Manufacturers' Association of Cast Iron Soil Pipe and Fittings: "On September 1 next the minimum weight on Cast Iron Soil Pipe and Fittings in carloads will be advanced by railroads to 40,000 pounds., instead of 30,000 pounds, as at present. This also refers to Cast Iron Pipe and Connections and to Sinks, Cesspools and all goods of a kindred nature."

The Thompson Meter Company, 79 Washington street, Brooklyn, N. Y., have issued under date of July 1, 1902, a reduced price-list of their Disk Water Meters, as follows:

Disk Water Meters.			
Ordinary Register, Round Dial; or, Star Register, Straight Reading.			
5/8-inch size.....	\$10.66	2-inch size.....	\$66.66
¾ " "	16.00	3 " "	120.00
1 " "	21.33	4 " "	233.34
1½ " "	40.00	6 " "	500.00
Connections for Lead or Iron Pipe per Set, Extra.			
5/8", 53 cents; ¾", 80 cents; 1", \$1.06.			
Sizes and Prices of Fish Traps.			
5/8", ¾", and 1", \$6.67; 1½" and 2", \$8.00; 3", \$13.34; 4", \$20.00; 6", \$26.67.			

Cast Iron Goods.—An advance in the prices of Cast Iron Specialties has been made within the last week or two. Among the goods which are higher are Hollow Ware Cooking Utensils and Pitcher Spout Pumps.

Fall Goods.—Considerable activity is noted in the demand for certain goods for fall and winter use. Manufacturers and dealers report a heavy call for Coal Hods, Stove Boards, Elbows, &c., which compares favorably with the demand in any previous season.

Eave Trough and Conductor Pipe.—The manufacturers of Eave Trough and Conductor Pipe made a change in the price of these goods under date of July 21. Galvanized Corrugated Conductor, nested, is now quoted at 75 per cent. discount, and not nested at 70 and 12½ per cent. discount, similar discounts being quoted for Plain Round Conductor, nested and not nested. Galvanized Eave Trough is quoted at 80 per cent. discount in less than carload lots.

Tarred Roofing and Sheathing.—In the business of Tarred Roofing products everybody seems to be mid-summer busy, with a firm market and probability of a scarcity of stock and slow deliveries as soon as the fall trade sets in. Prices at present remain about the same as were made last spring, which, however, were sharply advanced at that time in consequence of the absorption of important competing interests and the working agreement arrived at with some of the independent concerns whose business was not taken over. Tarred Roofing, single ply, is now quoted \$32 per ton, in less than carload lots; two-ply Roofing Felt, 65 cents, and three-ply, 87 cents per roll, the prices covering light to heavy weight stock. Rosin Sized Sheathing, in rolls of 500 square feet, is quoted at 37 cents, light, 25-pound rolls; 45 cents, medium, 30-pound rolls, and 60 cents, heavy, 40-pound rolls, in less than carloads. Slaters' Felt is 75 cents per roll, less than carloads, the rolls containing 500 square feet.

Wire Nails.—The demand for Wire Nails is confined largely to small lots. While the summer quiet affects the demand from nearby territory, small lots from store are moving in satisfactory volume, considering the season. Small lots from store are quoted at \$2.25 to \$2.30 per keg.

Cut Nails.—No change was made in the price of Cut Nails at the regular meeting of the Nail Association this week. The prices for July were reaffirmed for the month of August. The demand for Cut Nails is moderate, small lots from store being quoted at \$2.30 per keg.

Window Glass.—The local Glass market remains quiet, with the future a matter of uncertainty. The Jobbers' Association quotations for Window Glass, single and double strength, from store, remain at 88 and 5 per cent. discount.

Linseed Oil.—But few orders of any size are being placed for prompt delivery. A fair business in small

lots of Oil is reported and the market is firm at the prices quoted last week, City Raw in small lots ruling at 68 to 68½ cents per gallon.

Spirits Turpentine.—During the week liberal deliveries of Turpentine on local contracts have supplied most requirements and restricted the demand to small lots. Receipts at Savannah are reported as large, with a depressing effect upon prices at that point. Quotations here are about ½ cent lower than a week ago, Turpentine in small lots from store ruling at 47 to 47½ cents per gallon.

Old Rubber.—The market for Scrap Rubber is fairly active and prices are firmer than they have been of late. Dealers in New York and vicinity are now paying about the following figures:

Car Springs, ton lots, per lb.....	5c.
Rubber Shoes, less than carloads, per lb.....	6¾ to 7c.
White Wringer Rolls, per lb.....	7c.
Inside Bicycle Tubing, per lb.....	21½c.
Outside Tubing, per lb.....	5½c.

The Celluvarno Company, Newark, N. J., have reduced their prices for treating Water Closet Tanks and Seats with their patent preparation. Seats and Covers are now treated in dozen lots at \$5 each and Tanks in dozen lots at \$8, the same to be furnished by the owner.

Attractive Mantel Design.

Some of our readers will be interested in the many designs of attractive mantels, open fire places, grates, &c., which are shown in a catalogue recently issued by

Attractive Mantel Design.

Charles F. Lorenzen & Co., 288 North Ashland avenue, Chicago, Ill. The various lines which are sold direct from the factory cover a handsome assortment of mantels adapted for the modern dwelling and, as indicating the character of the work turned out, we present the accompanying illustration of a mantel which would be appropriate for a parlor, or, in fact, almost any room in a modern dwelling. The construction involves elaborate hand carved Renaissance capitals, swelled shelf and heavy cornice. It is made of choice quarter sawed oak or birch, and is treated in what is known as piano finish. It has heavy veneered columns, 4½ inches in diameter; a tile opening, 42 x 42 inches, and a mantel width of 5 feet.

In connection with their mantels the company have introduced a new idea in mounting the tile. It is pointed out that the fact that a person cannot procure the services of a skilled mason to set the tiles need not deter him from buying a tiled mantel, as the company's method of mounting tile on slate provides for this contingency and obviates the need of a mason, while it

renders the setting up of a tile mantel a comparatively easy matter. The catalogue which the company have issued, illustrating and describing an extended assortment of wood mantels, grates, tiles, grilles, &c., shows their work to great advantage, and we understand that any one desiring a copy of the publication can procure it by sending to the address given above.

To Pickle Brass Castings.

The following method of pickling brass castings is recommended by an exchange: If greasy, the castings should be cleaned by boiling in lye or potash. The first pickle is composed of nitric acid, 1 quart; water, 6 to 8 quarts. After pickling in this mixture the castings should be washed in clear warm or hot water, and the following pickle be then used: Sulphuric acid, 1 quart; nitric acid, 2 quarts; muriatic acid, a few drops. The first pickle will remove the discolorations due to iron, if present. The muriatic acid of the second pickle will darken the color of the castings to an extent depending on the amount used.

Remittances should be made by draft, payable to the order of DAVID WILLIAMS COMPANY, on any banking house in the United States or Europe, or by Post Office, Bank or Express Money Order. When these cannot be obtained, postage stamps of any country will be received.

Newsdealers or Booksellers in any part of the world may obtain The Metal Worker through The American News Company, New York, U. S. A.; The International News Company, New York, U. S. A., and London, England; or The San Francisco News Company, San Francisco, Cal., U. S. A.

Entered at the Post Office, New York, as Second-class Matter.

LABOR EXCHANGE.

Notices under this heading of reasonable length are inserted free of charge. Only those relating to employment are admitted. Write distinctly on one side of paper only, and do not use postal cards.

Original letters of reference should not be inclosed with replies to advertisements appearing in these columns as they are frequently mislaid and lost. A copy of the reference will serve the purpose.

HELP WANTED.

METAL STAMPER. "M. S." care *The Metal Worker*, New York. Aug. 2

All around TINNER and CORNICE WORKER; state wages wanted. Chas. F. Hauck & Co., 35 West Main street, Springfield, Ohio. Aug. 2

First-class MECHANIC, experienced in galvanizing iron, cornice and blow pipe work. John H. Sharer, 1606 and 1608 Cherry street, Toledo, Ohio. Aug. 2

A good cornice and skylight maker as FOREMAN who is a good cutter and can estimate on work from plans, and who can take full charge of shop, including the roofing line if required to do so; must not be afraid of work; no need to belong to union; a good job for the right man. "Employer," care *The Metal Worker*, New York. Aug. 2

First-class CUTTER on cornice work. M. F. Westergren, 433 East 144th street, New York. Aug. 2

A young man of good address, preferably having some acquaintance with architects and builders in New York city, to solicit opportunity to estimate on plumbing work; one who can secure interviews with leading men and arrange for bids to be submitted; knowledge of the details of plumbing unnecessary; good connection with house of good reputation open to one having the right qualifications. A BARGAIN.

For Sale. A well established Tinning, Plumbing, Heating and Stove business, of 19 years, in one of the busiest towns in Maryland, on main line of B. & O. R. R. Cash trade, large profits, no opposition: sales \$1800 last year. This is a chance of a lifetime. \$8,500 will buy buildings, stock, tools and good will. Building has frontage of 70 ft., depth 60 ft.; two storerooms, 20x60, and dwelling, 35x60, ware room in rear, 32x32, and tin shop, 20x60. One storeroom is renting for \$250. Terms one-half cash. Must be sold at once. Reason for selling, am going into the manufacturing business in New York State.

Address "WALLACE,"
Care The Metal Worker, New York.

FOR SALE.

Plumbing, Heating and Tinning business in a growing town of 4000 population in Eastern Mass. Town has water works and is putting in sewers. Only shop in town. Is an extra good chance. Have a good set of tinner's and piping tools, stoves, tinware, etc. \$600 buys it if taken now. Will sell on easy terms. Good reason for selling. Address

BOX 185, Billerica, Mass.

FOR SALE.

An old established Stove, Furnace, Tinware and Plumbing business, in a well located store in the town of Dover Plains, N. Y., on the Harlem R.R., doing a very good local business and having no competition. An excellent opportunity.

Address JOHN WILLIAMS,
Dover Plains, N. Y.

Something New.

Just the thing for tinner, cornice makers and sheet metal workers. No long hours poring over old foggy text books or working deep mathematical problems, but a simple, practical course of instruction in sheet metal pattern cutting, taught by mail. Course of thirty-three lessons, including one hundred plates 13 x 18 inches, covering the subject completely, for the exceptionally low price of \$16.50. Write to day for full particulars and free sample plates.

THE HOME INDUSTRIAL SCHOOL, Canton, O.

A BARGAIN.

A complete set of Tinner's Tools at one-half price. Some have been in use one year. They are good as new. Write for list at once. Also one Eb Slide Trombone Brass Horn I wish to sell. It cost \$18.00: will take \$5.00. It is in good shape.

W.M. A. JOHNSTON, Williamson, W. Va.

Tinsmith's Shop For Sale.

Roofing and Cornice Shop for sale. Good jobbing trade. In a good location on the West Side on 8th Ave. Full stock of tools, consisting of brake, etc. Will sell cheap to quick buyer. Reason for selling, owner leaving city. Inquire

M. GARDINER,
640 Greenwich St., New York.

FOR SALE.

A valuable manufacturing property, situated at 23d and Smallman streets, Pittsburgh, Pa. Remarkably well located as to shipping facilities, consisting of new steel constructed building 118 x 154 feet, thoroughly equipped with suitable machinery and tools for working in sheet metals. This establishment has a long ground lease, on very favorable terms and a large trade that will naturally follow it. It is the only concern in the Pittsburgh district, with all machinery for making corrugated conductor pipe, eaves trough, ridge roll, &c. This is an opportunity to secure a bargain for one desiring a business that can be operated at once. Any one caring to investigate, with object of buying the building, machinery, &c., or any practical party with capital, caring to take an interest in the business, please address

H. L. IRWIN,
Receiver for Marlin & Co., Inc., Pittsburgh, Pa.

FOR SALE.

Iwans' Perfection Wire Conductor Pipe Hanger.

Best Hanger Ever Invented.

Why It Is The Best:

- 1st. It holds pipe one inch from building to permit painting.
- 2d. It looks ornamental.
- 3rd. It can be used for frame or brick buildings.
- 4th. It can be used for round or corrugated pipe.
- 5th. It completely encircles the pipe, holding it firmly on all sides.
- 6th. It is strong and durable.
- 7th. It is cheaper than any other hanger.
- 8th. A tinner can put up more pipe in less time than with any other hanger.

The hanger can be tightened as desired by giving the eye a twist. For 2-inch corrugated pipe 2½ inch hanger is required. Other pipe runs uniform.

Also Manufacturers of Iwans' Chimney Top.

IF IT LASTS IT'S A G.A.P.H. ROOF

50 YEARS

No Other Plates have as
much LIFE in them as

Gummey's Anti Pin-Hole
Genuine Charcoal Iron Plates.

THEY MAKE A PERFECT ROOF.

IMPORTED AND SOLD ONLY BY

Gummey, McFarland & Co., - = Philadelphia.

DOES IT PAY

to use coated sheets in place of black? It does if you use the ALUMINUM COATED. Some of our customers are using it as a substitute for copper. It can be soldered with common solder.

STEEL & IRON ALUMINUM COATING CO.,
CONNELLSVILLE, PA.

"Thereby Hangs a Tale."

THE piazza was broad, as was also the man sitting thereon. Upon his countenance he wore a perplexed look, as who should say "W'at t'ell?" His much advertised "50 Year Roof" was leaking and, as the rain drops fell upon him, he arose and smote himself for not using Meurer's Genuine Charcoal Tinned Iron Sheets, as advised by his tinker. When his wrath abated, he resolved to save all future trouble by removing the tin that had proved so poor and henceforth and forever to use none but the Original Tinned Iron. Whereupon he sought the wise tinker before mentioned, and learned from him that the only way to be sure of a perfect lasting roof was to see that every sheet of tin purchased by him bore this stamp—

**How
to
Make
the
Best
Roof**

M F Roofing Tin is the first requisite; capable work the second—that is all—except, the roof will last 50 years. The manufacturers of M F Roofing Tin have lately published a complete manual of roofing and roofing material which will be sent free to anyone interested in roofs.

**MF
Roofing Tin**

is made entirely by hand labor—the "old-style" process. It has the heaviest coating of pure tin and new lead—impervious to rust or atmospheric gases. Ask your roofer—or for a copy of the book,

TINSMITHS HELPER *and* PATTERN BOOK

WITH USEFUL RULES,
DIAGRAMS and TABLES
= By H. K. VosBurgh =
NEW AND IMPROVED EDITION

A USEFUL hand-
book for tin-
ners and other
mechanics, treat-
ing simple prob-
lems in pattern
cutting, such as
are of daily occur-
rence in the shop.
An elementary
manual for the
young tinsmiths
A handy reference
for all sheet metal
workers.

120 Pages
53 Figures

An Invaluable . . . \$1.00
Pocket Companion . .

Section 1 ~ Pages 1-66 Diagrams and Patterns

Demonstrates in a simple way, and by means of illustrations and descriptive text, about 50 examples of sheet metal pattern work, such as the method of cutting can breasts, flared tinware, scale scoops, oval boiler covers, lips for measures, elbow patterns, &c.

Section 2 ~ Pages 69-88 Epitome of Mensuration

Compiled with regard to the requirements of the tinner, describing how to find the area of a circle, the circumference of a circle, the contents of a sphere, a cylinder, a cone, and other information relating to the work of a tinsmith.

Section 3 ~ Pages 89-120 Tables, Rules, Recipes

Gives tables of the weights of sheet metals, including the weight of black sheet iron, sheet lead, and galvanized iron sheets with their dimensions; the weight of lead pipe per foot; the weights of tin plates, sheet copper and sheet zinc. Several pages are devoted to tables giving the areas and circumferences of circles, the capacity of cans, the number of barrels in cisterns and tanks, sizes of tinware in form of frustum of a cone, &c., and practical receipts, including mixtures for solders of different kinds, soldering fluxes, and various cements.

Guaranteed strong and storm proof. Can be set up by anybody without tools.

The New Metal Worker Pattern Book.

425 Pages. 744 Illustrations.
Size 10 x 13 inches.

A new treatise on pattern cutting as applied to all branches of sheet metal work.

Cloth Bound, Price \$5.

This work contains a collection of 218 problems and an elaborate explanation of the principles of pattern cutting, including Triangulation.

It embodies the problems of the former Metal Worker Pattern Book, all of which have been revised, and many of which have been entirely rewritten and solved by more approved methods. To these have been added 75 new problems and much other new material and explanatory matter, making this work a model of completeness in every respect.

ARRANGEMENT.

In point of arrangement the new work far surpasses the former one in that the problems are classified under three different heads, and simply indexed, and also that by means of a table of contents any required department of the work can be easily found.

CONTENTS.

While Chapter VI, comprising the greater part of the work, is devoted to the solution of problems, the five preceding chapters thoroughly explain the principles of pattern cutting, and place the student in possession of the preliminary information necessary to a thorough understanding of the subject.

SUMMARY OF CONTENTS.

- I. Terms and Definitions—15 pages.
- II. Drawing Instruments and Materials—13 pages.
- III. Linear Drawing—6 pages.
- IV. Geometrical Problems—35 pages.
- V. PRINCIPLES OF PATTERN CUTTING—25 pages.
- VI. PATTERN PROBLEMS (3 Sections)—325 pages.
 1. MITER CUTTING,
 2. FLARING WORK,
 3. TRIANGULATION.

All Tanners, Cornice Makers and Sheet Metal Workers should be provided with a copy of

Our Improved Eureka
Cornice Brake. Will bend
No. 20 iron.
96 inches long.

HERCULES SHEARS

make the cutting of sheet metal of heavy gauges an easy task for the mechanic and a profitable operation for the employer. With them a man can cut No. 12 steel with one hand on the lever, leaving the other hand free to guide the stock while cutting elbows, ties and circles, as small as 8 inch radius; this is done without burring or buckling either piece, thus avoiding hammering and straightening, which add to the cost of the product. They split sheets of any width or length up to No. 12 gauge, cut wire or bar-steel $\frac{1}{8}$ inch thick, cut off and mitre angle iron $\frac{1}{8}$ inch thick, and do it perfectly.

AMERICAN STEAM and ALTITUDE GAUGES, POP SAFETY VALVES.
 Heating Specialties. American Steam Gauge & Valve Mfg. Co., Blsmark St., Boston, U. S. A.

That hot air furnace that is offered to you at such a low price will take just as much coal to fill the firepot as a Paragon Furnace would and will not give your customer nearly as much heat in his house. The reason the Paragon costs more is that above the firepot are located very extensive surfaces which absorb a large portion of the heat generated by the fuel consumed before it passes up the chimney. The difference in price is paid but once — the man who uses the Paragon saves money every year by saving heat.

QUICK MEAL

Steel Ranges

Have the Appearance that Attracts Attention.

Have the Features to Talk About.

A FEW REASONS WHY QUICK MEAL RANGES ARE SO POPULAR:

FIRST.—Their construction is entirely different from other ranges. They are made by Steel Range makers.

SECOND.—They are not encumbered with a lot of heavy, useless cast iron ornaments that make your freight bill high and are liable to break in handling.

THIRD.—Their designs are new and of the latest pattern. They are built from a practical standpoint and have many features that attract attention and furnish points to talk about.

QUICK MEAL STEEL RANGES ARE GROWING IN POPULARITY EVERY DAY.

MILLER GAS RANGE

Is as economical in the consumption of gas as any Range.

The Baking is simply perfect, and cannot be excelled by any other Range.

The Broiling is grand, broiling any kind of a steak in from seven to ten minutes.

Is durable and simply constructed, so that any one can learn to run it in a few minutes.

Has drop doors which form shelves in front of the ovens, so that you can baste without holding the pans.

Is the handsomest Range ever built.

The oven can be drawn out from the front, so that if it should ever need repairing or replacing it can be done without cutting the Range all to pieces.

The price is as low as any one can build a first-class Range for.

The only "All Steel" Gas Ranges in the Market.

310	31 "	62 "	52 "	135 00	17 00	7 50

The "DIGHTON OAK" is made especially for burning wood, but is as well suited for coal, coke or gas for fuel. The general type of construction is exactly the same as the regular "DIGHTON" which has become so well-known as a durable and economical heater. The outside measurements, flue construction and flue measurements are the same; the large double feed doors allow of taking in large chunks of wood or a 4-foot stick cut once.

The wood grate is not fastened to the fire pot or coal grates; it rests upon the triangular grate bars, and by easily turning these bars the fire is thoroughly cleaned.

If at any time it may be desirable to use coal instead of wood as fuel, this grate can be removed in a minute's time through the feed door and set aside until such time as you wish to change to burning wood again.

DIGHTON FURNACE CO., Taunton, Mass.

GILT EDGE

stands for best when applied to furnaces. The many dealers who have installed and the thousands of householders whose homes have been heated by our furnaces show they like the Gilt Edge, as will be seen by the testimonials they have written. Let us send you a few of them.

The Keystone Joint used in Gilt Edge Furnaces is the only permanent gas tight steel and cast iron joint on the market.

MILWAUKEE

BOYNTON'S**Steel
Dome
Furnace**

The best example of the down draft type of wrought metal furnace in the market. The wrought metal work is made of heavy gauges of the best steel plate, with the most thorough workmanship, leaving no possibility of a leakage of gas. Catalogue and prices will interest you.

The BOYNTON FURNACE CO.,
NEW YORK. CHICAGO.

IF YOU ARE NOT SELLING THE

Peck-Williamson Underfeed Furnace

you have not the trade and are not making the money you might. Just a pull or two of the lever feeds the new coal from underneath.

The Underfeed Furnace consumes less fuel than any other furnace ever built. The coal is burnt more slowly. All the heat units from it, as well as from the smoke, are utilized and all smoke eliminated.

Our handsome booklet explains its splendid heating qualities and coal saving.

You may have this booklet and our special plans for selling. Ask for booklet about our Laundry Dryer also.

Burn Hard or Soft Coal, or Coke. Large Doors.

Some Ripe Experience

Has come to us through watching the doings of dealers throughout the United States.

We find that the dealer who sells cheap furnaces not only loses ground in the furnace business but also has a falling off in his other lines.

On the other hand, we can say that the man who sells a good furnace and charges enough to do a good job will, in a few years, be the leading furnace man in his town and at the same time build up his other business.

The *American Furnace* is made for the better class of trade; is durable, clean and economical in fuel.

THE BONNOT COMPANY, - Canton, O.

The Helios-Upton Co.'s

First on the Market. 150,000 Sold.

No. 420, with Projecting Lamina Cover.
3 inches in diameter.**STANDARD
Oven Indicator**

has a dial graduated in the simplest possible manner, as can be seen. This graduation was adopted because every oven has its own peculiarities, and an indicator adjusted to one oven might be incorrect for another. The *Standard* can be adjusted to any oven and has no complicated parts. Made in 3 styles.

Send for circular.

CLEVELAND, O.**ACME (THE HEIGHT OF PERFECTION)**

The Acme Oven Thermometer is made in a first-class manner from start to finish. The case is composed entirely of steel, and is practically indestructible.

They are put up in separate boxes and sealed, making a nice, neat package.

This cut shows the indicator placed in the door panel. Our thermometers are made in two sizes, 3-in. dial and 2 5/8-in. dial, and can be used on any gas or coal stoves and ranges. Write for sample.

**Evans Stamping and Plating Company,
TAUNTON, MASS.**

C. H. MATTHEWS, Detroit, Mich. (Western Agent).

A Tea-Kettle Boils Quicker on my Chimney than on my Stove.

A fire in a red glow represents 1200 degrees of heat, a draft through this carries the heat out of the chimney unless intercepted by a cross tube **Rochester Radiator**, when nearly all this waste heat is conveyed into the room by the rapid circulation of air through the tubes and saved. This appeals to common sense and is verified by the most thorough scientific test.

The **Rochester Radiator** is a satisfactory article to sell and one that affords the dealer a good profit.

Semi-Sectional View.

Every Practical Stove Dealer

knows that heat without circulation is valueless. The best circulator gives the best heat.

New Era Radiators have *perpendicular* tubes. They take the cool air in at the bottom and rapidly heat it in the natural way *as it ascends*. Their construction tends to *increase* circulation instead of *retard* it, as tubes in any other direction would. All the products of combustion are compelled to touch the outer or inner surface of the tubes and the maximum amount of heat is radiated and circulated throughout the room.

If you would sell the best Radiator, you must buy the best. "*New Eras*" are best in material, best in workmanship, best in appearance, and best in results. Made in three styles and many sizes. Prices are right, affording a large margin. Don't buy something cheap on which you make but little. People are willing to pay a fair price for a good article. Send for our inducements now and be prepared to talk *New Era Radiators* at the right time.

Furnace Heating. COAL HODS.

A Practical and Comprehensive Treatise on Warming Buildings with Hot Air, by William G. Snow, with an Appendix on Furnace Fittings. 170 pages; size, 6 x 9 inches. Cloth bound. Price, \$1.50.

This is the only book that has been brought out which presents a systematic and reliable treatment of the warm air furnace system of heating.

It deals with the various types of furnaces, their construction, proper location and setting, together with furnace fittings, and all matters pertaining to the installation of furnaces and to effective and economical heating by warm air. The subject is discussed for the first time by a competent author possessed of a scientific education and a practical training, who presents positive rules, based on a long experience, for guidance in designing furnace systems for dwellings and other buildings where this popular method is employed. The various details of furnace work are described simply and at such length that the volume will be valuable to all who are in any way interested in the subject. It is recommended to practical furnacemen, to architects, builders and house owners, and to tinnery and plumbers in suburban sections who do furnace work. To all these it will prove a reliable text-book and guide.

PARTIAL SUMMARY OF CONTENTS BY CHAPTERS.

Chapter I.—Furnaces—Is devoted to Furnace Construction—The Relative Proportion of Furnace Parts—Secondary Heating Surface—Economy and Efficiency—Heating Capacity and Exposed Wall Surface—Manufacturers' Ratings of Their Own Productions, etc.

Chapter II.—House Heating—Compares Furnaces and other apparatus, and describes Method of Setting Brick and Portable Furnaces—Location and Area of Cold Air Supply—Cold Air Rooms and Air Filters—Return Ducts and Air Circulation—Size of Hot Air Pipes—Location of Registers, etc.

Chapter III.—The Combination System—Discusses Heating Distant Rooms with Radiators—Balancing the System—Location of Water Heater in Furnace—Capacity of Water Heaters—Size of Radiators, etc.

Chapter IV.—Air—Deals with the Necessity of Ventilation—Water Needed to Moisten Air—Expansion of Air—Velocity of Air in Tubes, etc.

Chapter V.—Heating and Ventilation of Buildings—Considers the Size of Furnaces Required—Fresh Air Room and Supply—Air Circulation—Size of Flues—Use of Stack Heaters—Size of Heating coils in Vent Flues, etc.

Chapter VI.—Heating of Public Buildings, Churches and Stores—Is given to the Size of Furnaces Required—Grate Surface in Ventilated Buildings—Air Supply—Size of Heating and Ventilating Flues—Size of Stack Heater, etc.

Chapter VII.—Fan-Furnace Combination System—Is devoted to Positive Warm Currents from Fan Systems—Location of Fan and Driving Apparatus—How Good Furnaces are Aided by Fans—Types and Efficiency of Fans—Area of Ducts and Flues, etc.

Chapter VIII.—Temperature Control.

Chapter IX.—Estimate and Contract Blanks.

Chapter X.—Value of Fuels. The Proper Size for Furnace Chimneys—with tables.

APPENDIX.

Furnace Fittings.—A section of 45 pages dealing with the Making of Furnace Casings—Metal Cold Air Boxes—Making Furnace Bonnets and Collars—Making Pipe and Elbows—Register Boxes and Stack Shoes, etc.

The Climax RATCHET STOCK

Is an indispensable tool for conveniently threading iron pipe in ditches, under floors, in corners, over head, etc. With this tool threads can be cut without removing whole lengths of pipe. This tool is provided with a strong vise which securely grips the pipe and by means of the leading thread the die is forced on pipe and the thread is cut. It is made of malleable iron and steel, and while light in weight, making it convenient to carry, is very strong and rigid. The advantages of this tool make it absolutely indispensable to Plumbers, Steam and Gas Pipe Fitters, Gas and Water Companies, Machinists, etc. It takes standard size dies, which are extra if furnished.

No. 1 threads $\frac{1}{4}$ to 1 in. pipe takes 2 or $2\frac{1}{2}$ in. die, \$10.00.

No. 2 threads 1 to 2 in. pipe, takes $2\frac{1}{2}$, 3 and 4 in. die, \$17.00.

Plumbing and House Drainage Problems.

244 Pages; 146 Illustrations; Size, 6 x 9½ inches. Cloth bound. Price, \$1.50.

This volume is devoted to practical plumbing and house drainage, treating many of the most difficult problems arising in the practice. Much of the subject-matter is presented in the form of questions and answers. The answers, as a rule, consist of descriptions of methods of properly installing work, accompanied by appropriate illustrations, which make the text clear. Incorrect ways of doing work are also pointed out, accompanied by examples of successfully installed plumbing and drainage. Hot water circulation and hot water supply in buildings are treated at considerable length.

PART OF CONTENTS:

DANGEROUS BLUNDERS IN PLUMBING.

Running Vent-Pipe in Improper Places—Connecting Soil-Pipes with Chimney-Flues—By-Passes in Trap-Ventilation, etc.
A Case of Reckless Botching.
A Stupid Multiplication of Traps.
A Trap Made Useless by Improper Adjustment of Inlet and Outlet Pipes.
Unreliability of Heated Flue as a Substitute for Proper Trapping.
Need of Plans in Doing Plumbing-Work.

HOUSE-DRAINAGE.

City and Country House-Drainage—Removal of Ground-Water from Houses—Trap-Ventilation—Fresh-Air Inlets—Drain-Ventilation by Heated Flues—Laying of Stoneware Drains.
Requirements for the Drainage of Every House.
Ground-Water Drainage of a Country House.
Ground-Water Drainage of a City House.
Fresh-Air Inlets.
The Location of Fresh-Air Inlets in Cities.
Air-Inlets on Drains.
The Proper Way to Lay Stoneware Drains.
The Tightness of Tile-Drains.
Danger of Soil-Pipe Terminals Freezing unless Ends are without Hoods or Cows.
Objection to Connecting Bath-Waste with Water-Closet Trap.

How to Adjust the Inlets and Outlets of Traps.
How to Protect Trap when Soil-Pipe is used as a Leader.
Size of Ventilating-Pipes for Traps.
How to Prevent Condensation Filling Vent-Pipes.
How to Prevent Accidental Discharge into Trap Vent-Pipe.
Why Traps should be Vented.

MISCELLANEOUS.

Syphoning Water through a Bath-Supply.
Emptying a Trap by Capillary Attraction.
As to Safety of Stop-Cocks on Hot Water Pipes.
How to Burnish Wiped Joints.
Admission to the New York Trade Schools.
Irregular Water Supply.
Hot Water from the Cold Faucet, and how to Prevent it.
Disposal of Bath and Basin Waste Water.
To Prevent Corrosion of Tank Lining.
Number of Water Closets Required in a Factory.
Size of Basin Wastes and Outlets.
Tar Coated Water Pipe Affect Taste of Water.
How to Heat a Bathing-Pool.
Objections to Galvanized Sheet Iron Soil-Pipe.
To Prevent Rust in a Suction Pipe.
Automatic Shut-Off for Gas Pumping Engines, when Tank is Full.
Paint to Protect Tank Linings.

Size of Water-Pipes in a House.
How to Make Rust Joints.
Covering for Water-Pipes.
Size of Soil-Pipe for an ordinary City House.
Where to Place Burners to Ventilate Flues by Gas Jets.
How to Prevent Water Hammer.
Why a Hydraulic Ram does not Work.
Proper Size of Water-Closet Outlets.
Is a Cement Floor Impervious to Air?
Two Traps to a Water Closet Objectionable.
Connecting Bath-Wastes to Water-Closet Traps.
Objections to Leaching Cesspool and Need of Fresh Air Inlet.
The Theory of the Action of Field's Syphon.
How to Disinfect a Cesspool.
Slabs for Pantry Sinks—Wood vs. Marble.
Test for Well Pollution.
Corrosion of Lead Lining.
Size of Flush Tank to Deal with Sewage of a Small Hospital.
Details of the Construction of a House-Tank.
The Construction of a Cistern under a House.
To Protect Lead Lining of a Tank, and Cause of Sweating.
Stains on Marble.
Lightning Strikes Soil-Pipes.
How to Fit Sheet Lead in a Large Tank.
Why Water is "Milky" When First Drawn.
Carving-Tables.

Is Galvanized Pipe Dangerous for Soft Spring Water?
How to Arrange Hush Pipes in Cisterns to Prevent Syphoning Water Through Ball Cock.
Depth of Foundations to Prevent Dampness of Site.
Self-Acting Water Closets.
Wind Disturbing Seal of Trap.
How to Draw Water from a Deep Well.
Cause of Smell of Well Water.
Absorption of Light by Gas Globes.
Fitting Basins to Marble Slabs.

How to Construct a Filtering Cistern.
Objections to Running Ventilating Pipe into Chimney-Flue.
Size of Water Supply Pipe for Dwelling House.
Faulty Plan of a Cesspool.
Disposing of Refrigerator Wastes.
Pumping Air from Water Closet into Tea Kettle as Result of Direct Supply to Water Closets.
Danger in Connecting Tank Overflows with Soil-Pipes.
Arrangement of Safe Wastes.
What is Reasonable Plumbers' Profit?

HOT WATER CIRCULATION IN BUILDINGS.

HOT WATER SUPPLY IN VARIOUS BUILDINGS.

Steam Heating Problems.

233 Pages; 109 Illustrations; Size, 6 x 9 inches. Cloth bound. Price, \$1.50.

This book contains a compilation of questions, answers and descriptions relating to Steam Heating and Steam Fitting, expertly treated and adapted to the wants of those who design, construct and have charge of steam-heating apparatus. The work embodies results of some of the best experience and practice in the trade, presenting solutions of many difficult problems connected with the steam-fitter's work. We reproduce some of the subject-matter headings of Steam Heating Problems, which are of interest as indicating the practical character of the problems and questions which are treated.

BOILERS.

On blowing off and filling boilers.
Where a test-gauge should be applied to a boiler.
Domes on boilers; whether they are necessary or not.
Expansion of water in boilers.
Cast vs. wrought iron for nozzles and magazines of house-heating boilers.
Pipe-connections to boilers.
Passing boiler-pipes through walls; how to prevent breakage by settlement.
Heating-boilers. (A problem.)
Isolating-valve for steam-main of boilers.
On the effect of oil in boilers.
Proportions for rivets for boiler-plates.
Iron rivets and steel boiler-plates.
Is there any danger in using water continuously in boilers?
A supposed case of charring wood by steam-pipes.
Domestic boilers warmed by steam.

VALUE OF HEATING-SURFACES.

Computing the amount of radiator-surface for warming buildings by hot water.
Calculating the radiating-surface for heating buildings—the saving of double-glazed windows.
Amount of heating-surface required in hot-water apparatus boilers and in steam-apparatus boilers.
Calculating the amount of radiating-surface for a given room.
How much heating-surface will a steam-pipe of given size supply?
Coils vs. radiators and size of boiler to heat a given building.

Calculating the amount of heating-surface.
Computing the cost of steam for warming.

RADIATORS AND HEATERS.

Improper position of radiator-valves.
Hot-water radiator for private houses.
Remedying air-binding of box-coils.
How to use a stove as a hot water heater.
"Plane" vs. "Plain" as a term as applied to outside surface of radiators.
Relative value of pipe on cast-iron heating surface.
Relative value of pipe on steam-coils.
Warming churches (plan of placing a coil in each pew).
Warming churches.

PIPE AND FITTING.

Steam-heating work—good and indifferent.
Piping adjacent buildings: pumps vs. steam-traps.
True diameters and weights of standard pipes.
Expansion of pipes of various metals.
Expansion of steam-pipes.
Advantages claimed for overhead piping.
Position of valves on steam-riser connection.
Cause of noise in steam-pipes.
One-pipe system of steam-heating.
Air-binding in return steam-pipes.

How to heat several adjacent buildings with a single apparatus.
Air-binding in return steam-pipes, and methods to overcome it.

VENTILATION.

Size of registers to heat certain rooms.
Determining the size of hot-air flues.
Window ventilation.
Removing vapor from dye-house.
Calculating sizes of flues and registers.
On methods of removing air from between ceiling and roof of a church.

STEAM.

Economy of using exhaust steam for heating.
Heat of steam for different conditions.
Superheating steam by the use of coils.
Effect of using a small pipe for exhaust steam-heating.
Explosion of a steam-table.

CUTTING NIPPLES AND BENDING PIPES.

RAISING WATER AUTOMATICALLY.

MOISTURE ON WALLS, ETC.

MISCELLANEOUS.

Heating water in large tanks.
Heating water for large institutions and high city buildings.

Questions relating to water-tanks.
On heating several buildings from one source.
Coal-tar coating for water-pipe.
Filters for feeding house boilers.
Other means of clarifying water.
Testing gas-pipes for leaks, and making pipe-joints.
Differential rams for testing fittings and valves.
Percentage of ashes in coal.
Automatic pump-governor.
Cast-iron safe for steam-radiators.
Preventing fall of spray from steam-exhaust pipes.
Heating and ventilation of a prison.
Amount of heat due to condensation of water.
Expansion-joints.
Resetting of house-heating boilers—a possible saving of fuel.
How to find the water-line of boilers and position of try-cocks.

MISCELLANEOUS QUESTIONS.

Applying traps to gravity steam-apparatus.
Connecting steam and return risers at their tops.
Power used in running hydraulic elevators.
On melting snow in the streets by steam.
Arrangement of steam-coils for heating oil-stills.
Converting a steam-apparatus into a hot-water apparatus and back again.
Condensation per foot of steam-main when laid under ground.

These books will be sent postpaid on receipt of price, \$1.50 per copy.

Stoves and Fuel.

Now that the strike of the anthracite coal miners has lasted three months, the stove trade begin to feel that its continuance may have a disagreeable effect on the business of the year, which at the outset gave promise of a large volume of trade and better prices. The conditions governing prices continue to warrant the advances which have been quite generally made, while the employment of labor in all branches at good wages enables those who desire them to secure better home conveniences. Notwithstanding these conditions, however, reports from the districts in which hard coal is used indicate that the local dealers fear the scarcity and high prices of anthracite will make it necessary for them to reduce the size of the orders already placed for both heating and cooking stoves. The difficulty of securing a supply of hard coal for the kitchen range has already been thoroughly discussed by the housekeeper and the coal merchants. Therefore there is little opportunity for argument by the stove dealers throughout the hard coal country in the interest of the heating and cooking stoves they are displaying. Although there is little encouragement for their coal stove trade the dealers are seeking to secure business in other lines. They are now making inquiries about gas and oil heaters, and evidently anticipate securing some trade in this class of goods. That their interest in these goods is timely is proved by the inquiries made by their customers about the samples which they are now displaying.

The fuel question is one that has received a good deal of consideration in different sections of the United States during the year. California and Texas are enthusiastic over the development of oil within their limits. This gives them a fuel at home, without long hauls and expensive freight, and they have been quick to devise apparatus for use in the fire chambers of all kinds of furnaces in which other fuels were used heretofore. The strike among the anthracite miners has led to the use of soft coal in the East to a large extent in all kinds of factories and buildings, with a distribution of soot as a by no means agreeable result. The probability of securing a supply of hard coal for heating residences is already being questioned, whether for use in hot air furnaces, steam or hot water boilers or the high grade and less pretentious parlor heaters which have been an important factor in the occupation of the foundries. Already inquiry is being made of the manufacturers by the local dealers as to whether or not certain stoves, furnaces and boilers can be used for burning soft coal if neces-

sary, and if not, what equipment can be provided to adapt them for that fuel. There can be no doubt that soft coal will be burned during the year in many residences which have heretofore been heated by hard coal, and the dealer will have frequent occasion to remove soot from the flues of the heating apparatus and also to clean the chimneys.

Inquiries have also been made for fuel oil burners for stoves, furnaces and boilers. These inquiries are not only sent to manufacturers of coal goods, but also to those who have made a specialty of oil cooking and heating apparatus, the opinion evidently being that the oil stove manufacturers, having solved the problem of making burners for the smaller apparatus, can readily devise burners that can be used with economy with the larger apparatus. Unfortunately, even in the Eastern oil fields, burners suitable for cooking and heating with oil fuel have not been developed to such an extent as to be thoroughly satisfactory. The burners that are suitable for boilers in charge of an engineer are hardly adapted to household use. While a number of fuel oil burners that have been put on the market at various times have been used in houses, apparently none of them have continued long in popular demand. Numerous little details need to be perfected in the construction of a fuel oil burner designed for household use before such a device can be made generally acceptable and the liquid fuel become widely available for domestic purposes.

Agricultural Prosperity.

The Iron Age has gathered reports on the condition of business from all sections of the United States—East, West, North and South—which give a very comprehensive idea of the business condition of the country at the present time. These reports come from 45 States and Territories and fill 36 closely printed columns. The testimony presented by conservative and intelligent business men in all sections indicates, with almost practical unanimity, that the country's crops this season are excellent and that the agriculturalists are exceedingly prosperous. For a long series of years "prosperity," whenever it came, applied more particularly to the industrial part of the community—that is, to the mechanic, the factory and mill worker, the railroad employee, &c. The poor farmer seemed to get a discouragingly small proportion of the good things. But now, with largely enhanced prices for his products, he appears to thoroughly appreciate his good fortune and is making a proper disposition of the proceeds in the way of freeing his farm from the burden of debt and making improvements which operate to the benefit of neighboring merchants and artisans.

The Need of Trade Schools.

It is remarkable how little attention is being paid by the public press to the subject of trade schools. Notwithstanding that the need for the extension of these institutions throughout the country is conceded by all those who have studied the matter to any extent, the movement seems to evoke little or no enthusiasm on the

part of the public. Meanwhile vast numbers of boys who if provided with facilities for obtaining a proper trade education could be furnished with the means for earning a good livelihood and becoming useful citizens of the republic, are growing up and going out into the world without any adequate industrial equipment. A refreshing exception to the general indifference in regard to this matter is noted in the strong plea for more trade schools recently presented in the New York *Evening Post* by Joshua C. Pumpelly. The writer points out that we have in this country a certain number of manual training schools where children are taught, in general, to use their hands and eyes; but of trade schools, pure and simple, where boys may learn a handicraft by which they can earn an honest living, there are lamentably few. The New York Trade School, founded by the late Colonel Auchmuty, is an example of what is needed in this line, and the New York Hebrews, with the aid of the De Hirsch Fund, have established a somewhat similar work for the Jewish boys. Then there are a few comparatively small trade schools in Boston, Hartford and one or two other Eastern cities, while the Board of Education of Springfield, Mass., has recently achieved the unique distinction of establishing a public trade school. This is about all that is being done at present in this important field. The American boy who is ambitious to learn a trade is to-day obliged to pick up a rudimentary knowledge of his chosen handicraft as an apprentice or helper, struggling all the while against the influence of the unions, whose general policy is to oppose, by every means in their power, the training of future rivals to the selfish union members, and against the disinclination of the workmen themselves to impart to others the knowledge they possess. The result of this discrimination against the American boy, which is very general among workmen, is that vast numbers of youths, many of them of more than average capacity, unable to gain even the precarious foothold of apprenticeship in any trade, are forced to seek a living by their wits, taking up whatever presents itself and drifting, in too many cases, into a life of shiftlessness, if not of dishonesty.

A Good Investment.

In the sharp industrial competition which is one of the characteristics of the age, an immense advantage has been derived by European manufacturers from the trade and technical schools which have been established on the Continent. Germany affords a striking illustration of this fact. Since the inauguration of the trade school system in that empire, but a comparatively few years ago, German manufactured articles, which were formerly almost unknown outside of the Fatherland, have penetrated into all the world's markets. And the same thing holds good, in a lesser degree, of France, Switzerland and Belgium, in all of which countries trade schools are an established institution. Great Britain, too, is awakening to the need of trade schools and the movement has received a great impetus in that country in the past few years. America, almost alone of the civilized and progressive nations of the world, lags behind in this important economic movement. And the only valid excuse for this state of things is that the trades unions are opposed to them. But surely the general prosperity of the country, the well being of the community and the future of the rising generation should weigh against the selfishness of a limited number of union workmen. Trade schools are among the best investments any country can make. Not only do they produce useful citizens, capable of supporting themselves and their families, but they develop, by the

superiority of workmanship which they inculcate, markets for the manufactures of the country and promote an industrial excellence which tends to the prosperity and well being of the whole nation.

Our Foreign Trade in Iron and Steel.

An increase of \$10,000,000 in the imports of iron and steel manufactures and a decrease of \$19,000,000 in the exports of that class of manufactured products is the most striking feature of the foreign commerce of the United States in the fiscal year ended June 30, 1902. The total imports of manufactured iron and steel in that period amounted in value to \$27,180,255, against \$17,874,789 in the preceding year, while the exports of iron and steel manufactures were \$98,552,562, against \$117,319,320 in the preceding year. This makes the imports of the year in this class of materials larger than those of any preceding year since 1893. For many years prior to 1901 the exports of iron and steel had steadily increased, while the imports as steadily decreased. Exportation of iron and steel manufactures increased from \$12,000,000 in value in 1880 to \$121,000,000 in 1900, while imports decreased from \$67,000,000 in 1882 to \$12,000,000 in 1899. The increase in the imports of iron and steel last year was general, practically every class showing much larger figures in 1902 than in 1901. Tin plate, for example, shows an increase of over \$2,000,000, and pig iron, ingots, blooms and bars each over \$1,000,000, with other classes in about the same proportion. The cause of the reduction in exports of iron and steel is twofold; primarily from the fact that the home demand for iron and steel products was so heavy last year that there was practically little or no surplus left to send out of the country, while, secondly, the low price ruling in foreign markets last year deterred American manufacturers from making any particular effort to market their goods abroad.

Assets of the United States Steel Corporation.

For the first time since the organization of the United States Steel Corporation a detailed statement of the assets of the properties has been furnished. This statement was called forth by a suit brought by a stockholder, who asked for an injunction to prevent the company from carrying out their bond conversion plan.

The assets, it is stated, include 400 producing mills of the value of \$300,000,000; 75 blast furnaces of the value of \$48,000,000; iron and Bessemer ore properties of the value of \$700,000,000; coal and coke properties of the value of \$100,000,000; natural gas fields of the value of \$20,000,000; cash in bank to the amount of \$66,000,000, and over \$80,000,000 of material in the process of manufacture. The total value of the company's property, including cash and cash assets, is placed at \$1,409,291,000 by Mr. Schwab in an affidavit which is part of the corporation's reply. The company's earnings are stated to be at the rate of more than \$140,000,000 a year. A saving of \$40,000,000 a year is credited to the ore properties, and it is estimated that the ownership of transportation facilities saves the company \$10,000,000 annually. The earnings of the coal and coke properties are stated to be more than \$1,000,000 a month.

These statements as to values and earnings were presented by President Charles M. Schwab to disprove a charge that a false certificate was presented by the company's officials when they certified that the properties were worth at least the par value of the preferred stock after deducting all indebtedness.

The Fort Pitt Natural Gas Company and the Manufacturers' Light & Heat Company have advanced the prices of natural gas from 22½ to 25 cents per 100 cubic feet, net, in the Pittsburgh district, thus equaling the rates charged in that city.

HOW TO HANDLE RANGE PEDDLERS.

We are in receipt of a letter from a stove dealer in a Western city who gives his experience in meeting the competition of steel range peddlers, which will undoubtedly be read with interest by many who find their trade injured in the same manner. He says:

"Ours is an agricultural community, our city depending almost exclusively on the patronage of farmers. Just now we are having a phenomenal trade in steel ranges. Some range peddlers operated here for several weeks and got a great many people interested. We then instituted a thorough and heavy campaign of advertising against them, putting a wagon out ourselves and selling a range which is only handled through dealers. The result was that we drove the peddlers out of this vicinity after making them pay over \$40 taxes to our county and city. The best part of our experience is that we sold over 30 of our ranges in as many days, with the immediate prospect of selling as many or more in the next 30 days. We have learned that the most successful way to sell high-class ranges is to send a wagon load with a salesman out into the country so as to get the undivided attention of the farmer's wife. She only gets to town occasionally and then seldom visits a stove store except on the most urgent necessity. Her time in town is spent in dry goods or grocery stores, but when we get her attention and succeed in interesting her at her own home, if she needs a range or cook stove we make the sale. We sell at strictly one price to every one, a price that gives us a handsome margin, and yet it is \$10 to \$12 less than the price at which the peddlers sell their ranges."

Stove dealers in general should learn a lesson from our correspondent's experience. He has profited by adopting part of the methods of the enemy. This is in line with the suggestions editorially made in these columns some weeks since. The way to sell more stoves is by endeavoring to reach the people directly and not by waiting for them to drop into the store.

THE SUMMER STOVE TRADE.

As usual, the weather has exerted some influence on the summer stove trade, the difference this year being that it has been so cool that the demand for oil cooking apparatus has by no means come up to the expectations of the smaller dealers. Unless the balance of the season develops more buying than has been experienced hitherto, a considerable stock of these goods will be carried over. Already the failure of dealers to dispose of their stock is reflected in collections, which are said to be slower than in previous years. This is disappointing, as the early indications were that the season would be a good one. All classes were occupied at good wages, and it was expected that the buying of household conveniences this year would be generous. Unfortunately, however, the cool weather has had a bad effect on the sale of all kinds of summer goods. The manufacturers of oil heating stoves report that buyers are showing a lively interest in this class of goods, particularly in sections where hard coal is the customary fuel. The early orders for oil heaters have been gone over by the buyers, and the tendency is growing to increase the orders, sometimes doubling them up.

Michigan Stove Company's Entertainment.

The Michigan Stove Company entertained about 250 persons on the occasion of the unveiling of the bronze tablet on their grounds at Detroit, July 31, to which allusion was made in our last issue. The gathering was composed of the best citizens of Detroit and included some of the early settlers. After the ceremonies they were invited into the company's main building, sample room and offices, where a collation was served, which added to the pleasure of the day.

The tablet now stands facing a thoroughfare over which thousands of persons travel daily, as it is not only one of the main streets of the city but it also leads to very popular summer resorts—namely, Belle Isle

Park, the Water Works Park, the Boulevard, &c. Those who pass are attracted by the tablet and thus are impressed with the fact that the spot so marked is historic ground. George H. Barbour, vice-president and general manager of the company, who had active charge of the arrangements, expresses himself as more than satisfied with the results.

The Iron Molders' Union of North America.

The international convention of the Iron Molders' Union of North America concluded its business in Toronto, Canada, on July 22, after selecting Philadelphia as the place of meeting in 1905. The election of officers resulted as follows:

President, Martin Fox, Covington, Ky.
First Vice-President, Joseph F. Valentine, San Francisco, Cal.
Second Vice-President, M. Keough, Troy, N. Y.
Third Vice-President, J. Fry, Worcester, Mass.
Fourth Vice-President, John Campbell, Quincy, Ill.
Secretary, E. J. Denney, Cincinnati, Ohio.
Assistant Secretary, John G. Weaver, Covington, Ky.
Financier, R. H. Metcalf, Cincinnati, Ohio.
Treasurer, Alexander Faulkner, Cleveland, Ohio.
Editor Iron Molders' Journal, David Black, Cincinnati, Ohio.

The following were elected to the Executive Board: John Bradley, Poughkeepsie, N. Y.; P. Murphy, Richmond, Va.; James H. O'Neil, Providence, R. I.; George Digel, Memphis, Tenn.; A. R. Mitchell, Montreal; John Loder, Pittsburgh, and L. O'Keefe, Detroit, Mich.

The members of this board spent their whole time traveling in the interests of the union, reporting from time to time to the head officers at Cincinnati, Ohio.

Five hundred and twenty delegates attended the convention.

The Galvano Patent Lock Stove Pipe.

Hemp & Co., St. Louis, Mo., are now manufacturing a new line which they term the Galvano patent lock stove pipe. This pipe is made of the best grade of gal-

The Galvano Patent Lock Stove Pipe.

vanized iron, is swedged and crimped, has a double lock seam and can be easily put together by any one, without the use of hammer or rivets, by simply pressing or bending in the notch, which securely fastens the pipe. It is practical for all purposes, but is especially adapted for the use of lumber mills, factories, plantations, railroads, &c., and is recommended for damp climates, where other material would readily rust. The pipe is packed in 25 and 50 joint lots, in crates similar to that shown in the illustration. It is made in 5, 5½, 6 and 7 inch diameters. The company are prepared to furnish for use with this pipe any size tapers or reducing joints, also galvanized four-pieced or corrugated elbows.

CONDITIONS IN THE STOVE MOLDING INDUSTRY.

The address of President Martin Fox at the meeting of the representatives of the Iron Molders' Union at Toronto, Canada, on July 7, contains much that is of interest to the stove trade, and we present below some extracts from it. After dealing with the developments of the industry and the trying position of the national officers and expressing himself in favor of yearly agreements, Mr. Fox stated that the molders now enjoy the best wages and conditions they have experienced for 25 years. His special references to the stove molding branch were as follows:

Under our conference arrangements with the Stove Founders' National Defense Association the advance of 10 per cent. on 1898 prices has been supplemented by a further advance of 5 per cent. in 1900 and 5 per cent. additional on April 1 of the present year. Thus the stove plate branch of the trade has sustained a flat advance of 20 per cent., which, with the numerous readjustments of low paid work that have been made possible by buoyant trade conditions, represents a very substantial increase in the earning power of our members who follow this branch of the trade.

AGREEMENTS OF VALUE TO BOTH SIDES.

Our observations and experiences during the past term, when wage advances were so prominent a feature of our work, confirm me in the belief that wage agreements covering a specified period are desirable. They insure a period of peace for the prosecution of the no less important work of the union, and introduce an element of certainty into the industry which is of positive value to both the molder and his employer. It is my earnest hope that this view will meet with favor in this convention.

PERMANENT RESULTS OF MORE VALUE THAN TEMPORARY GAINS.

It is quite true that although the improvement in the wages and conditions of our members have been most marked during the past term, some have protested with emphasis at times that we were not moving forward fast enough. That thought has sometimes thrown our members in some localities and the national officers into seeming antagonism. As a general rule, sounder judgment has prevailed and harmony has been restored; but still we are aware that there is an impatient element among our membership who are loud and insistent in their denunciation of the national officers as bars to their progress, and another, though inconsiderable portion, who carry their traduction to the point of charging partiality to the interests of the employers. How absurd, illogical, not to say uncharitable, such an attitude is, must be apparent to any one who will give the subject a moment's thought. The truth of the matter is that those impatient ones have not yet realized that no movement can advance too rapidly without inviting disaster. My every effort, my every energy has been devoted to promoting orderly and substantial progress and establishing conditions that might endure, rather than to furthering a policy which, succeeding for a moment, is followed by a reaction that loses for us a portion of what we originally held. The policy of an organization of the standing and experience of the Iron Molders' Union of North America should be to build a substantial structure and not a castle of cards.

SHORTENING THE WORKING HOURS OF THE DAY.

At the time of the Indianapolis convention it was ordered that a vote of the membership be secured on the proposition to establish an eight-hour day. The vote resulted 12,367 in favor and but 796 against. That result was conclusive enough, but the problem of how to put it into practical effect, it will be admitted, was a serious one. At the meeting with the representatives of the Stove Founders' National Defense Association, which took place a month after the result of the vote was known, the question of an eight-hour day in the stove foundries was brought up for discussion and, as anticipated, met with very pronounced opposition from the manufacturers, and nothing of a substantial nature was accomplished.

ADVISED AGAINST SYMPATHETIC STRIKES.

In May, 1900, the National Metal Trades' Association and the International Association of Machinists entered into an agreement, which, among other things, provided for the inaugurating of a nine-hour work day in the shops of the members of the association on May 20, 1901. From the dissatisfaction expressed with certain features of this agreement and misunderstandings as to its meaning which subsequently developed, I antici-

pated that the nine-hour day would not be inaugurated in the machine shops without serious trouble, and in every instance where our locals asked for advice upon the proposition of taking part sympathetically in the machinists' movement, I strongly advised against it. With the exception of our locals in San Francisco and several points in the Northwest the advice was heeded, and the final result proved its wisdom.

Although it might be thought this was an inopportune time to agitate a shorter work day in the foundry, we nevertheless tested the sentiment in the Central West and found that, with the exception of St. Louis and one or two smaller places, there was a preference for a further wage advance.

THE APPRENTICE RATIO.

Following the conference held with the representatives of the Stove Founders' National Defense Association in the spring of 1901 a very interesting discussion took place upon the ratio of apprentices to journeymen. A vote was finally taken upon a proposition to establish a one to five ratio, and upon another to establish an intermediate ratio between one to five and one to eight. A referendum vote, in which, I regret to say, only about two-fifths of our membership recorded their votes, resulted in the one to five proposition being defeated by a vote of 15,842 against 504, and the second proposition by a vote of 12,314 against 3978. While this vote might be interpreted to indicate the fixed determination of our members to abide by the ratio which has been embodied in our laws for more than a quarter of a century, I deem it my duty to bring the subject prominently to the notice of this convention, believing, as I do, that our very best interests demand that we give it our most unprejudiced and intelligent attention.

LACK OF INTEREST SHOWN BY MEMBERS.

While the referendum is undoubtedly founded upon correct principles, the result of its use in labor organizations has not always been in harmony with progressive thought. It is an unfortunate fact, but truth compels me to say it, that our members do not give important questions submitted to their decision the careful study and intelligent thought they should, but allow themselves to be swayed by their prejudices or their fears, or display by their indifference and their failure to record their opinion their lack of interest in propositions submitted.

UNION RATIO NOT UNIFORMLY ENFORCED.

In considering the subject of a ratio of apprentices we must bear in mind these points: The ratio of one apprentice to eight journeymen is a law of the Iron Molders' Union, but is not assented to as equitable by any association of foundrymen or any employer, with but few exceptions, and is only recognized where the union has the power to compel its recognition. Thus it is an ever present danger point in our relations with our employers in prosperous seasons, and is honored more in the breach than the observance in periods of depression. I am not insensible to the force of the argument that there are employers who would without scruple hire low paid boys in preference to men were there no restraint upon them; and that knowledge, together with the reasons previously advanced, has convinced me of the desirability and advantage of a ratio which will be assented to and enforced by the best element of foundrymen, in preference to the present policy of recognition when conditions permit its enforcement. There are two parties to every bargain legitimately ratified, and if we would win the recognition of the foundrymen for a ratio of apprentices, we must give consideration to what they deem their interests as well as our own, and be prepared to liberalize, if necessary, the present ratio which, I have no hesitancy in saying, can be done without serious injury to our interests.

THE TRADE NEEDS MORE MOLDERS.

As you are well aware, the ratio of apprentices has become a very prominent subject of discussion with the members of the Stove Founders' National Defense Association. As a result of the conference agreements which have been a feature of our relations with that body since 1891, strikes, a prolific source of supply of molders, have largely disappeared in the stove plate foundries, and the supply, we hope, will soon be dependent upon the union ratio. It is to be expected that should this convention determine to increase the present ratio of apprentices or empower its representatives to negotiate with foundrymen's associations, a ratio mutually agreeable, there would be considerable discontent and complaint at the outset; but so confident am I that such a policy will result in turning out mechanics of greater competency, operate to the material advantage of this union and establish much desired uniformity, that I submit to you my strong recommendation to liberalize the present ratio of apprentices and conform it, intelligently, to the needs of a growing industry.

THE UNION MOLDERS' ATTITUDE TOWARD THE MOLDING MACHINE.

It was my privilege to call the attention of the Indianapolis convention to a growing problem of our craft—the molding machine. During the remarkable trade activity which has been a feature of the past three years the rapidly increasing demand for the products of the foundry has stimulated the introduction of molding machines where duplication of work made them profitable. The higher minimums which have been established have also tended to promote their use in the foundry. Laughed at some years ago, the machines have demonstrated their usefulness, and few there are among the molders who will deny their success or their economy on classes of work for which they are adapted.

It is no longer the simplest kind of work that is made upon the molding machine, for every year has seen an extension of its sphere, until to-day work of a very high grade is being made successfully upon them. As the grade of work made upon the molding machine improves in quality, it follows that a higher degree of skill is required of the operator. Thus, in some instances, foundrymen have found it more profitable to employ journeymen molders as machine operators upon the better class of work.

Becoming alarmed apparently at the attention given the machine question by the Indianapolis convention, and misinterpreting our purpose to mean a limitation of its output, if not actual opposition to its introduction, the foundrymen, especially members of the National Founders' Association, have determinedly opposed the proposition to employ molders as operators except, as stated above, where their skill was absolutely essential to successful operation. At several conferences with representatives of the association we have sought to reach an understanding whereby molders will be given preference as operators, but without success.

MACHINE OPERATORS ORGANIZED.

No good purpose will be served by deceiving ourselves as to the measure of success that has attended the experiment of the foundrymen in educating bright young men to be machine operators. On the common run of work they have been fairly successful, and these so called "unskilled" operators have in time become highly trained specialist molders. Taking that view of it, the Executive Board, at a meeting held in Cincinnati during September, 1901, determined to make a new departure, and granted a charter to the machine operators of Indianapolis, Ind., who were admitted to membership subject to certain limitations. I am glad to be able to say the experiment has proven very successful; wages have been advanced, the local has made satisfactory progress and is to-day represented by delegate in this convention as Machine Operators' Union No. 382.

The demand for skilled molders will not always be as great as it is to-day, and we can well conceive the time when the molder who would now refuse to take a job as a machine operator will be glad of the opportunity. I desire to emphasize one point, however, and that is, he will never be given that opportunity unless he is willing to do justice to the possibilities of the machine and shows a willingness to conscientiously assist in its development. Our original attitude toward the machine was a shortsighted and mistaken one, and the resulting injury to our own interests cannot be removed by a perpetuation of the early prejudice.

DANGER IN AFFILIATION WITH OTHER TRADES.

I realize that our interests lead in the direction of close alliances with kindred trades, but from a careful survey of the Metal Trades' Federation I am inclined to the thought that it will not be prolific of practical results. Among the organizations in affiliation are some who are not only very young in the movement, and consequently very inexperienced, but inherently weak and unable to withstand a serious attack. This weakness must necessarily communicate itself to any combination of which they are a part and prejudice its movements. In addition to this it might be urged that while the constitution of the federation expressly provides for careful investigation and consideration before a general strike is undertaken, our affiliation with the several metal trades would materially increase the danger of our local unions becoming sympathetically involved in the numerous unauthorized strikes in which their members, apparently without much effort or restraint, become involved. For these reasons I am of the opinion that our interests will be best served by remaining out of the Metal Trades' Federation and concentrating our efforts toward strengthening our position in the foundry itself.

LIMITATION OF OUTPUT.

One of the most popular charges against trades unionism is that it designs to arbitrarily limit output

and to oppose the introduction of systems and devices designed to increase the productivity of the workman. Employers' associations have used this very effectively of late years in their efforts to discredit trades unionism in the minds of the public. That the charge is, in the main, unjust needs no argument of mine to convince this convention. The Iron Molders' Union has taken the ground, and will maintain it, that it will countenance neither arbitrary and unreasonable limitation of output on the part of its members, nor equally arbitrary and unreasonable exactions on the part of an employer.

LIMITATIONS OF EARNINGS A FAILURE.

In an effort to resist this tendency some of our locals have put forth misguided efforts and have given color to the general and unjust accusation made by employers against the Iron Molders' Union. Nor has the union itself been entirely free from mistakes of this kind in its history, for many of you will have a distinct recollection of a law adopted, against the advice of many of our best thinkers, by the London convention of 1886, which essayed to prescribe a limit of \$3.50 per day upon the earnings of piece workers. It did not take long to demonstrate the impracticability of such legislation, and its unpopularity among the members in general, for the law not only remained a dead letter but was repealed at the first opportunity.

COMPLETE ABOLITION OF PIECE WORK IMPRACTICAL.

In accordance with the instructions of the Indianapolis convention a vote of the membership was asked upon the proposition to abolish piece work in the foundry. This we recognized to be a very important issue and contemplated a most radical change from the time honored system prevailing in several branches of our trade. Every effort was made to stimulate intelligent discussion in the *Journal*, but, I regret to say, our membership both in this and the subsequent vote displayed an apathy inconsistent with the gravity of the question. The vote, though a small one, was very decisively in favor of the abolition of piece work, standing 12,449 in favor and 1048 opposed.

In accordance with this expression the subject was brought up for discussion at the conference with the Stove Founders' National Defense Association representatives in March, 1900. The proposition that stove molding be placed upon a day-work basis was vigorously opposed by the conferees of the association and as vigorously urged by the union's representatives. Beyond demonstrating that the day-work proposition would meet with the strenuous opposition of stove manufacturers, the conference adjourned without much progress being made. Since that time no further attempt has been made to push the change in the stove plate foundries. As applied to those branches of the trade wherein the piece price system would be inequitable and unfair to the molder, the national union has always consistently opposed its introduction or sought to eradicate it. I am convinced, however, that in those subdivisions of the trade wherein the piece price system has been for many years the established and accepted custom, a change so revolutionary as the transition to a day-work basis would be will not only prove most difficult of accomplishment, but will develop most objectionable features and prove a disappointment to many who are now earnest in its advocacy. For these reasons I believe the interests of our members employed upon those classes of work which almost from the inception of the industry have been upon a piece price basis will be best conserved by efforts to regulate prices and conditions, rather than by any efforts we might make to abolish the system. As applied to the machinery or jobbing interests, I am unequivocally opposed to the introduction of piece work and in accord with all practical efforts to abolish it wherever it may exist.

THE PLASTIC STOVE LINING MAKERS.

The manufacturers of plastic stove linings held a meeting at the Union Square Hotel, New York, on Thursday, 6th inst. The president, W. H. Colebrook of W. H. Colebrook, Sons & Co., manufacturers of Crown stove clay, Syracuse, N. Y., called the meeting to order and the minutes of the previous meeting were read by the secretary, A. W. Perkins of the Rutland Fire Clay Company, Rutland, Vt. Other members of the trade present were Messrs. McFarland of the Bridgeport Crucible Company, Bridgeport, Conn., manufacturers of Champion stove clay; Williams of the Williams Stove Lining Company, Taunton, Mass., manufacturers of Eagle stove clay, and Wilson of Newburgh, N. Y., manufacturer of Wilson's Superior stove clay. The condition of business was thoroughly discussed and all expressed

themselves well satisfied with the trade now enjoyed. They decided to let present prices stand until their next meeting, which will be held in December.

Luster Backwalls for Open Grates.

A new line of goods which the H. Adler Company, Pittsburgh, Pa., have patented and are manufacturing this season is what they term the Luster Backwall for open grate fire places, intended for use with natural gas. In the accompanying illustration is shown an example of one of these backwalls, which are made entirely of stamped sheet steel, upon which is placed the asbestos fiber. This style of construction is claimed to be more durable and to burn better than the asbestos

Luster Backwalls for Open Grates.

back. These goods are furnished with asbestos, brass or black side flanges, in four sizes, from 18 to 24 inches wide.

Acorn Stoves and Ranges.

Rathbone, Sard & Company, who claim to be the oldest American stove makers, with Eastern foundries at Albany, N. Y., and Western foundries at Aurora, Ill., have favored us with a copy of Catalogue No. 67, which has just been issued for the season of 1902-1903. This publication is one of the most ornate specimens of book making which has ever been issued by a stove house. It is of large size, the pages being 10 x 12½ inches. It is substantially bound in boards covered with muslin of a purple color, which is at the same time attractive and conspicuous. Both front and back covers bear unique designs in gilt. The fly leaves are printed with an appropriate design, consisting of infinite reproductions of the company's trade-mark, surrounded by emblems of the founder's art. The paper used is egg shell paper, which is not often found in a trade publication. A half-tone tint surrounds each page. The engravings are printed in black, while the letterpress is printed in brown, and these colors, in combination with the tinted border, make each page a view in colors. The engravings are usually quite large, the size of the page enabling the stoves and ranges to be thus shown on a large scale, which brings out their special features much more completely than if the cuts were of small size. The catalogue contains 96 pages.

In the arrangement of the contents the goods have been divided into departments. The department divi-

sions are named at the bottom of each page. Thus, "Steel Ranges and Steel Cooks, pages 7 to 20," appears at the bottom of each page devoted to this department; in the same manner in the next department appear the words "Cast Ranges for Hard Coal, pages 21 to 41;" the next division bears the legend "Cast Ranges for Soft Coal, pages 42 to 46;" the next division covers "Cast Ranges for Wood, pages 47 to 51;" the next, "Cooking Stoves for Coal, pages 53 to 57;" the next, "Cooking Stoves for Wood, pages 59 to 65;" the next, "Base Burners for Hard Coal, pages 67 to 74;" the next, "Surface Burners for Hard Coal, pages 75 to 76;" the other divisions cover laundry stoves for coal, cannon stoves for coal, air tight heaters for coal, oak stoves for coal and wood, heating stoves for wood and steel air tight for wood. This arrangement enables the different divisions to be found very quickly, and is undoubtedly an improvement over the arrangement in the company's previous catalogue, which consisted of the use of an insert page for each department.

It will be observed from the foregoing enumeration of the different departments that the line shown by the company comprises a thoroughly complete variety of all classes of goods required by the stove trade. The goods also cover every grade needed by the trade, from the most highly finished, elaborately decorated and expensively constructed stoves to the low priced lines adapted to popular use. The conspicuously new goods shown in this catalogue include the following: The Modern Acorn, six-hole steel range, of medium grade, having a polished steel body, double asbestos linings throughout, patent brick lined fire box, high ventilated oven, sheet flues and every other feature required in all modern ranges, together with full nickel ornamentation; the Victor Acorn velvet finish four and six hole steel range, of the popular grade, having ends interlined with asbestos, heavy ventilated iron linings, together with other features which make it of thoroughly satisfactory construction; the Classic Acorn six-hole cast range, of the highest Acorn grade, furnished with heavy brick linings, double draft removable grate, heavy lined centers, ventilated high square oven, curved oven shelf with broad swelled edge, and in all respects most attractively finished both with regard to the molded work as well as decorations; the Perfect Acorn six-hole cast range, of medium grade, which is also constructed with a view to efficient service and attractive appearance; the Federal Acorn six-hole cast range, of an intermediate grade, which is also most attractively dressed and furnished with full modern features; the Empress five and six hole cast range, of the loose hearth pattern, with high carved base and more nickel ornamentation than usually found in ranges brought out for popular use; the Pride Acorn and Merit Acorn cast ranges for wood, which are attractive constructions, the same patterns being known respectively as the Lotus Acorn and Jubilee Acorn wood cooks; the New Royal Acorn base burner of the highest grade for hard coal, which is of massive construction with full nickel dome, large mica surface, broad deep flues, hot air circulation at the back of the stove and nicked base rails, hearth plate, door panels, knobs, &c.; the Brilliant Acorn base burner, of standard grade, for hard coal, original in design, with a new circulating system by which cold air is taken in at the bottom of the stove through an opening 4 x 7 inches, and forced in the large flue through the hottest part of the stove, making a powerful double heater if desired; the Rectort Acorn air tight heater for hard or soft coal, and the Hecla air tight also for hard or soft coal, less elaborately finished; the Acorn Oak, hard coal pattern, with illuminated front; the Glen Acorn oak for any fuel; the Charm Oak, a low priced construction, and the Garden Acorn, a new steel air tight with end door.

The company's agents are offered valuable suggestions in getting up advertising matter on some of the pages of the catalogue. For instance, on one page is reproduced the Acorn guarantee bond, which is furnished with every stove or range bearing the trade-mark name Acorn, which has for so many years been a guarantee of excellence. On another page is a stove parable,

which applies the parable of the sower of seed to the stove trade most happily. Another page shows a number of newspaper electrotypes ready for use, with space for the agent's name at the bottom. Another page refers to the Acorn sign, intended for the front of a dealer's store, giving suggestions how to hang the sign, as well as a complete description of it. A feature of interest is a page devoted to a quick discount table. This table covers discounts frequently used by manufacturers of stoves and hardware specialties and can be used to quickly figure the net cost of any article sold at the discounts named.

A collection of views is given, showing the company's Albany works, founded in 1830, and the Aurora works, established in 1890, as well as the Detroit, Chicago and San Francisco warehouses. Interspersed through the catalogue are illustrations of features of strength in steel ranges, as well as new ideas in construction embodied in the cast ranges, cooking stoves and heaters.

BALANCING A COMBINATION JOB.

BY BALLAST.

"Hearing is believing, but seeing is the naked truth." The reading of this article is, of course, equivalent only to hearing, but the time may come when some of the readers of *The Metal Worker* will be called on to look at such a case as we describe below. Then they will see the naked truth in combination work as we have seen it. If they tackle the problem and solve it successfully, they will, we think, agree with us that the experience gained is worth any half dozen of their own jobs they ever did.

In this instance the heating man evidently allowed his brains the same scope that the plasterer of the house did. His ideas certainly indicated that between two houses there could be no more difference, in his case, than there would be in that of the plastering of them. The matter came up to us in this way:

A gentleman, whom we will call A, came into our office one day last winter, and after the usual business small talk and preliminary assurances that he had been referred to us as being the loftiest authorities on the subject of heating, announced that he was possessed of a human error in its most aggravating form. He wanted us to help him find a name for it, and incidentally explain why it did him no service as a heating apparatus—that is, one part of it was of no use to him. He said it was a combination of hot air and hot water. What puzzled him most was to discover wherein the combination lay. Another thing that puzzled him was that his neighbor B just across the street, with precisely the same equipment, furnace and all, was thoroughly pleased with it. B had had his put in first, and it was on his recommendation that A had had the same man put a similar outfit in his house at the same price.

During one season's experience with it A had tried hard to get the heating man to come and remedy matters, even offered him financial inducements to a reasonable extent if he would improve the job. These entreaties had been met with refusal and the assertion made that no improvements were necessary. B's job was held up as illustrating the uselessness of giving some people a good job, the inference being, of course, that B knew how to handle a thing when he got it, and A didn't.

We met A at his house the following day by appointment, and were shown through it. It was a three-story and basement house in the middle of a block. The extension at the rear was two-story and basement and exposed to the north and west. The main house was warmed entirely by hot air, and the extension, presumably, by hot water. The house was decidedly comfortable, but the extension felt as if no heating provision had ever been made for it. The radiators and risers were barely warm. The furnaces proved to be of reputable make and of generous size for such a house. The fire was good and clean, but what would be called a slow fire.

We then crossed the street, a block further away, to

B's house. From an architectural standpoint there was little difference between the two. We found the same number of radiators in B's extension as in A's; also the same sizes; furnace the same size and make, and in all other respects the systems were identical. B's house, including the extension, was at a uniform temperature. This puzzled A so much that it was with difficulty we could get him to listen to us when we started our explanation. He did not grasp the idea readily, but, after seeing the light, as it were, he admitted that it was the naked truth.

His house faced south, which made it an easy matter to warm that end of it; the rear, north, being largely protected by the extension, made no abnormal demands on the furnace, which would indicate that, taken all through, the hot air part of the system was not taxed to any great extent. Naturally the fire was gauged to cater to these requirements, which kept it burning too slowly to heat the water to any serviceable temperature.

B's house, on the opposite side of the street, of course faced north. This fact compelled him to run his furnace more strongly than A in order to warm the front rooms sufficiently. This favored the hot water end to such an extent that the water, on an ordinary winter's day, averaged in temperature from 140 to 150 degrees F. The result was that B's extension was warmed satisfactorily most of the time. The main house being well warmed, and the tendency of the heat being toward the rear, also helped the extension. Everything favored the extension. The whole work seemed well balanced; but, in the light of A's job, it certainly seemed that such an end was arrived at more by good luck than good management.

Now the radiation that made B's extension comfortable, figured out according to cubic contents, was in the proportion of three to the hundred on the first floor, and two and one-half on second floor. Rather scant basis to work on in hot water, even under favorable conditions.

The generator was of cast iron and placed about 10 inches above the usual point of surface of the fire. It contained heating surface equal to 1 square foot to 30 feet of radiation. Now, taking A's job into consideration again, with its easier running fire, and the greater demand for radiation on account of exposure, it can readily be seen that, as it stood, it could not be of much service. The first thing we calculated on was to get a proper amount of radiation throughout.

We have noticed in a great many of the combination jobs we have put up that 170 degrees seemed to be the limit of temperature to which the water would rise. This we account for by the average rate at which city fires are run. With that experience in view we increased the surface to 4 feet to 100 on the first floor, and 3½ to 100 on the second floor. These ratios, where there are three exposures to consider and an ordinary amount of glass surface, will generally give the desired results in cold weather, if water can be maintained in the neighborhood of 170 degrees. The next thing facing us was that we must devise a means of increasing the generator power and arrange matters so that a brighter fire should be kept up. With the fire at its normal stage in this furnace it would not have mattered if we had made the whole inside of the furnace above the fire pot into heating surface for hot water, we could not have reached 170 degrees.

We first lowered the existing generator to within 5 inches of the usual point at which fire was kept; then by means of spiral coils of 1¼-inch pipe we increased the heating surface to 1 square foot to 18 square feet of radiation. The presence of so much water surface inside the furnace naturally lessened the effect of the fire in creating hot air. Hence the fire had to be run more strongly to do its hot air work. This, coupled with the increase in heating surface, brought our generative power up to about where we wanted it; slightly over, if anything. We warmed that extension easily and satisfactorily after that, and while the means taken to secure the results may to some appear excessive, yet we can assure them we would not care to tackle another one and use less surface in generator and in radiation. Of course, we mean where the conditions would be the same as in the above case.

The Michigan Stove Company's Catalogue.

What is called a supplementary catalogue of Garland stoves and ranges has just been issued by the Michigan Stove Company of Detroit and Chicago. This supplementary catalogue, however, is of such a high character in every respect that it would reflect credit on any stove manufacturer who would offer it as his chief work in the catalogue line. It is of large size, the pages being 10 x 12½ inches, enabling the illustrations of the stoves and ranges to be on a large scale. It is bound in stiff olive colored covers, the outside pages of the cover being ornamented with artistic designs. The Garland trademark is conspicuous in this connection.

The steel ranges shown comprise the Satisfaction Garland, Jr., for soft coal or wood, and the Sensation Garland, Jr., for hard coal or wood, which are six-hole ranges for the people at popular prices; the New Special Garland, for soft coal or wood, and the Signal Garland for hard coal or wood, which are well made six-hole ranges of still lower price; the New Staple Garland for soft coal or wood, and the New Savoy Garland for hard coal or wood, which are also moderate priced six-hole ranges; the Sunrise Garland, a four-hole range for either hard or soft coal or wood. The Sunrise Garland is also furnished in the form of a square steel cooking stove, adapted to the use of coal or wood. The Iron Age Garland is a new four-hole cast range, adapted to soft coal or wood and fitted with a steel oven, pouch feed, duplex grate, two flues, aerated oven and full nickel trimming. The New Woodland is a square cast cooking stove, mounted on feet only and intended for the exclusive use of wood. The Oak Garland is a new oak stove of the J series, having a square base, intended for any kind of fuel and constructed absolutely airtight. It has a heavy ball bearing coal grate with draw center, preventing the formation of clinkers. The Zenith Garland is a surface burner for soft or hard coal, of new and attractive design, having a square polished steel body with cast base and top. It can also be furnished with magazine for burning hard coal if desired. The new base burners shown comprise the Art Garland of the New Model series, which is quite a departure from the well-known designs, and the Art Garland New Series with patent nickel plated reflector top. The Gem laundry stove is also shown, as well as stoves with numbered parts to assist in ordering repairs.

ODD PLATES.

THE LINCOLN STOVE COMPANY, Cleveland, Ohio, are enlarging their plant at the corner of Euclid avenue and First street by taking in the building formerly occupied by the Lodge Cigar Box Factory. This expansion will enable the company to more than double their present output, and will necessitate making a considerable addition to their force of workmen.

MAHOOD & Co., 14 North Second street, Philadelphia, Pa., are sending to the trade a postal card bearing an interesting discourse about tags on Stove Repairs.

THE SUFFOLK STOVE COMPANY, Suffolk, Va., will, in the near future, begin the erection of their new factory on the line of the Suffolk & Carolina Railroad.

THE MALLEABLE IRON RANGE COMPANY of Beaver Dam, Wis., have issued a catalogue of 24 pages, bound in a brown cover, showing one of their Monarch Malleable Iron and Steel Ranges on the front cover, which is being viewed with admiration by a chef. The title page presents a bird's eye view of the company's plant, and is followed by pictures of their counting room, mounting shop, sheet metal shop and foundry. The tale of the Monarch Steel Ranges is told very entertainingly in detail, so that their constructive features and operation may be thoroughly understood. An illustration is given showing the oven section with the malleable iron frames for strengthening the seams; also views of the fire box section with water back and with lining; the back flue, extension to the fire box and the reservoir. The tops are of the French style, and are made of malleable iron. Half-tone engravings show the finished

Ranges in the variety of styles in which they can be furnished. The Monarch Range is one that the house have selected for a leader, while the Mound City Range is also well qualified to establish popularity through the excellence of its construction and equipment.

THE TUTTLE-ALLEN STOVE COMPANY, Kansas City, Mo., have been incorporated with a capital stock of \$20,000 by Frederick E. Tuttle, William E. Allen, Lulu M. Tuttle and Laura L. Allen.

THE Jones Patent Side Wall Warm Air Registers form the subject of a circular and a price-list recently sent out to the trade by the United States Register Company, Limited, of Battle Creek, Mich. A feature of the four-page circular is the plan of a residence heated with a furnace and convex and floor registers, and the same residence heated with a furnace and the Jones Side Wall Registers, with comparative estimates of cost, showing a substantial balance in favor of the Jones system, together with a material advantage in heating. A number of reasons why the Jones Side Wall Registers should be used are categorically stated on the last page of the circular, the front page giving views of the Register, with sectional cuts showing the methods of its installation for one and two floors. The company are also distributing blotters addressed to the furnace dealer, giving full information regarding their Register.

L. W. HEMP of Hemp & Co., St. Louis, Mo., the well-known manufacturers of Stove Pipe, Air Tight Heaters, &c., has recently gone on a pleasure trip to the Pacific Coast.

THE JACOB H. YOUNG STOVE COMPANY have been incorporated in New York with a capital of \$100,000. The incorporators are Charles Sanial, Robert Ingram and J. C. Thomson.

J. KONTNY is now sole manager of the Chicago branch of the Reading Stove Company. Up to June 1 Ross & Kontny were the Chicago representatives of the Reading Company. Mr. Kontny has just returned to Chicago from New York, where he made arrangements for the manufacture and sale of a new Steel Range. One carload of these Ranges, which is known as the Kontny, have already been placed with local and nearby jobbers, and will be delivered some time this month.

JOHN H. ROSS, who was formerly one of the managers of the Chicago branch of the Reading Stove Company, is now engaged in the Hardware business at Valparaiso, Ind., having purchased an interest in a retail store.

THE Chicago branch of the Michigan Stove Company are receiving numerous requests for their game counter, one of the advertising novelties brought out by the company, and which sprung into immediate popularity.

THE TWIN BURNER VAPOR STOVE COMPANY division of the American Stove Company, St. Louis, Mo., have removed their entire plant, including office and sales-rooms, to 906-908-910 South Ninth street.

GEORGE W. BUTCHER, secretary of Southard, Robertson & Co. of New York City, is enjoying a well earned vacation. His itinerary includes a trip by the Old Dominion Line to Old Point Comfort, Va.

W. H. COLEBROOK, SONS & Co., Syracuse, N. Y., manufacturers of Asbestos Furnace Cement and Crown Stove Clay, have had a long experience in their line of trade, but never before, they say, have they had such a large volume of business as this year. They have had to employ a much larger force of workmen and have consequently turned out a much greater product than in any previous year. Their Furnace trade has been especially heavy, owing to the great increase in the number of Furnaces manufactured.

"THE LARGEST PATTERN WORKS IN THE WORLD" is one of the claims presented in a new circular issued by the Gobeille Pattern Company, Cleveland, Ohio. It is a large sized folder, partaking of the artistic quality which characterizes alike the company's Stove Patterns and their trade literature. In stating that they make more Patterns than all the other public Stove Pattern shops in the country combined, the company give a list of

leading Stove concerns whose Patterns come from the Gobeille shops. All the company's Stove Patterns are made from designs and under the personal superintendency of Jos. Leon Gobeille.

THE details have finally been arranged by which the Pittsburgh Stove & Range Company of Pittsburgh will build a large Stove works at Beaver Falls, Pa. The various plants of this concern in Allegheny and Monongahela City, Pa., will be concentrated at Beaver Falls.

THE entire issue of stock of the Sangamon Mfg. Company, Springfield, Ill., has been taken and the shareholders were to meet at the end of this week for the election of officers. The company have secured the abandoned plant of the Patrons' Supply Company, at Mildred, southeast of Springfield, and will immediately begin the manufacture of Mine Tools and Cars, later going into the production of Stoves. The buildings secured are three in number, two being 60 x 600 feet and the other 80 x 100 feet. The principal promoters of the enterprise are Thomas Dwight, Luther Davis and Irwin Barker, all of Springfield.

E. J. HOLT, who for the past three years has been employed as secretary of the Glazier Stove Company, Ann Arbor, Mich., has resigned his position to engage in the house furnishing business.

THE RICHMOND STOVE COMPANY, Norwich, Conn., are making a number of changes at their plant at Thamesville. The building at the south of the factory, formerly used for storage, is being remodeled for an extension of the company's foundry facilities. This change will give employment to 25 additional molders and ten helpers. A shaft furnace for Foundry No. 2 is being set up which will melt about 18 tons of iron a day.

ANNUAL OUTING OF THE CHICAGO RETAIL HARDWARE ASSOCIATION.

The Chicago Retail Hardware Association held their eighth annual picnic on Wednesday, July 30, at Palos Park, located on the Wabash Railroad about 20 miles from Chicago. The attendance was unusually large, but through the co-operation of the railroad officials with the transportation committee of the association, ample facilities were afforded, making the trips going and coming very enjoyable. The day was ideal and the efforts of the committees on entertainments were crowned with success. The morning was devoted to general social enjoyment. Immediately after dinner, one of the most important functions of the day, the association took up a line of march, conducted by President D. McLaughlin and Treasurer J. L. Smith, and preceded by a band of 25 pieces, paraded about the grounds into the pavilion, where the members formed in a double row with a single connecting line, forming the letter H for Hardware. W. H. Bennett, local manager of the Reading Hardware Company, introduced D. W. Simpson, president of the Wilcox Mfg. Company, Aurora, Ill., who, on behalf of the association, presented Mr. McLaughlin with a gold headed cane in token of the esteem in which he is held by his fellow members.

Mr. McLaughlin in replying, after thanking the association for the unexpected gift, said that he was well aware that the success of the day's outing was largely due to the efforts of his maligned friends, W. H. Bennett and H. H. Roberts. He appreciated highly the honor bestowed upon him and promised to reply more fully to the members at their next meeting.

The formalities over the entire gathering joined with zest in the games which had been prepared by the committees. One of the most popular modes for the day's enjoyment was dancing in the pavilion. The races, in which the dealers, their wives, their sisters, their cousins and their aunts, as well as the children participated, were exciting and provoked much merriment. The judges of the contests were W. H. Bennett, H. H. Roberts, S. P. Johnston, D. W. Simpson and H. E. Builen.

Among the manufacturers, jobbers and agents present were the following, all of whom were from Chicago, except as noted:

Barrick, Wm. H., Abram Cox Stove Company.
Cutler, W. S., Ranney Refrigerator Company.
Dennison, C., C. Sidney Shepard & Co.
Fentress, Jas., Cleveland Foundry Company.
Geschwind, E. O., Landers, Frary & Clark.
Holt, Geo. D., National Enamelling & Stamping Company.
Hall, A. B., Whitman & Barnes Mfg. Company.
Johnson, J. K., Allerton-Clarke Company.
Lyman, W. B., Brand Stove Company.
Peglow, L. A., and Simons, E. L., Wells & Nellegar Company.
Roberts, H. H., and Partridge, W. T., *The Iron Age*.
Schmelzer, Louis, American Wringer Company.
Smith, J. L., Jr., Lisk Mfg. Company, Limited.
Stewart, A. T., A. T. Stewart & Co.
Vollrath, Carl, J. J. Vollrath Mfg. Company.
Wildener, M. B., Cook & Van Evera Company.
Whitlock, H. W., Reading Stove Works.

THE COMMITTEES.

Special credit is due to the several committees of the association for the successful manner in which all arrangements were made. These committees were composed as follows:

Executive Committee—Anthony Engelhardt, Frederick Ruhling, J. L. Smith, Frederick Kurtz, W. B. Costello, E. L. Sommers.

Transportation Committee—J. L. Smith, G. A. Lott, Geo. A. Neebe, J. H. Powers, H. E. Gnadt, W. J. Krueger, H. O. McClure.

Entertainment Committee—F. F. Porter, A. L. Adam, Martin Engelhardt, Otto Hagen, J. F. Borchardt, H. L. Peterson, O. Stebbins, Christian Carr, Jr.

Bowling Committee—Geo. A. Englehardt, E. Sanders, F. H. Schanze, C. A. Dalstrom, Hans Fehr, John Hora.

Games Committee—W. T. Gormley, D. McLaughlin, L. Rosenberg, Grant W. Porter, J. C. Schubert, J. M. Ruedell, B. F. Boysen, J. C. Wirths.

THE IRON AGE GUESSING CONTEST.

As an incident of the picnic the Chicago office of *The Iron Age* offered to the lady guessing nearest to the total number of advertisements in *The Iron Age* of July 31 a silver cake dish, and to the gentleman making the closest guess a dress suit case. Much interest was manifested by those present and the total number of ballots or guesses cast was 394; the lowest guess was 103 and the highest 14,197. Mrs. W. F. Rust, daughter of Treasurer J. L. Smith of the Association, and E. W. Drumm, connected with the New York Belting & Packing Company of Chicago, were the successful contestants, each guessing 1313. The total number of separate advertisements in *The Iron Age* of July 31, as counted by W. H. Bennett, local manager of the Reading Hardware Company, who had been selected as judge of the contest, was 1325.

The Gem Stove Pipe Damper.

Kramer Brothers, Dayton, Ohio, proprietors of the Dayton Stove Repair Works, are the manufacturers of the Gem stove pipe damper, of which an illustration is given herewith. Special attention is called to the long

The Gem Stove Pipe Damper.

and sharp pointed spindle with which the damper is provided and also the handsome nickel plated handle. These dampers are made in 11 sizes, from 3 to 10 inches in diameter.

CURRIE COMPANY, wholesale and retail Stoves, Hardware, Sporting Goods, plumbing, steam and gas fitting, &c., Atlantic City, N. J., are erecting a fire proof storehouse, four stories high, 50 x 105 feet. The new building adjoins their Atlantic avenue establishment in the rear. When improvements are completed the company believe that they will have one of the largest and best equipped stores of the kind in the State. The dimensions of the salesroom on the first floor will then be 50 x 205 feet.

gree. The benefit of the full depth is secured, so that there is practically no waste room, while the amount of literature that can be accommodated is large. While the case described is not full, it contains in the neighborhood of 1500 pieces of printed matter.

A Suggestion.

To any who may contemplate installing a card system, and who are not familiar with card indexes, it is suggested that the best quality of cards and guide cards be purchased. When they are frequently used even the best are none too durable, and the slight expense over poorer ones is insignificant compared with the time and trouble incident to recopying the matter on the cards.

Never-Burn Drip Pan.

The Bronson-Walton Company, Cleveland, Ohio, for whom John H. Graham & Co., 113 Chambers street, New York, are direct representatives, have just supplemented their line of Brown Beauty roasting pans, recently illustrated in these columns, by the addition of the Never-Burn dripping pan, here shown, which has some of the characteristics of the roaster, at much less cost. The Never-Burn pan has coppered steel rods along the bottom surface lengthwise, raising it from the oven floor and leaving an air space, which serves to keep an

Never-Burn Drip Pan.

even heat all around the pan and prevent burning on the bottom. The steel rods also take all the wear and permit the hot pan and its contents to slide easily in and out of the oven regardless of the weight of its contents. This style of pan is made variably of the best quality of sheet metal, as follows: Smooth, from Wood's refined iron; polished, from Wellsville polished steel, and still a third group from heavy tin plate. The handles are so secured to the pan that in lifting they stop in a horizontal position and at right angles with the pan, thus preventing burnt fingers in handling a hot utensil. The pans are all uniformly 2½ inches deep and of the following dimensions: 9 x 14, 10 x 12, 10 x 15, 11 x 16, 12 x 17 and 16 x 17 inches.

The Perfection Fruit Jar Wrench and Perfection Jar Holder.

Drake & Mills, Cleveland, Ohio, are introducing the fruit jar wrench and holder shown herewith. The wrench is stamped from hard steel and is nicked on

The Perfection Fruit Jar Wrench and Jar Holder.

copper, which produces a dull white finish. It is absolutely unbreakable, it is stated, and fits all sizes of fruit jar covers. It is built on the lever principle, the fulcrum crowding the arc of a circle against the jar top, which is surrounded by an annular ring, in such a way as to make a positive grip, without injuring the cover. The holder is designed to be used in connection with the wrench in holding the jar while tightening the cover and in carrying the hot jar to prevent being burned, obviating the necessity of wrapping the jar with a wet

cloth. There is no danger, it is remarked, in using the holder, as it would be impossible to crush the jar, as the band is of light flexible steel and makes a contact about the whole circumference of the jar. The holder is made from pressed steel and will fit any pint, quart or half gallon jar. It may also be used for tightening and removing the Canadian tops. The manufacturers express their willingness to send sample and give full information and prices to the trade.

Aluminum Dipping and Plating Baskets.

The accompanying cut represents an aluminum dipping and plating basket offered by Edward F. Smith &

Aluminum Dipping and Plating Basket.

Co., 23 Center street, New Haven, Conn. A special cloth is made for the baskets, while hard wire is used instead of soft to make them more rigid and less liable to be knocked out of shape. It is explained that the wires are crimped both ways of the mesh, so that the meshes are more even and the wires less liable to slip out of place; also that either iron, brass or copper wire is used, and that the frame work is very thoroughly put together. The baskets are made in a variety of styles, sizes and meshes, and the firm remark that they are ever ready to carry out the ideas of customers for any special baskets suited to their work. The baskets are referred to as particularly adapted to use in washing and dipping (except in potash), as acids have practically no effect on them, and they do not retain so much moisture and are not breakable as are the earthen ware.

A Wash Day Window Display.

A very effective window display recently made by the Los Angeles Hardware Company, Los Angeles, Cal., was devoted entirely to washday necessities. Four sizes of galvanized washtubs and two clothes baskets were set up on their sides to form a background. In front of these was placed a row of various sizes and makes of wringers. Then came a row of rollers for the wringing machines and a mass of clothes pins. In the foreground, next to the window, were placed numerous kinds of irons, from the largest sized charcoal burning iron for tailors' use down to the tiny iron used on babies' dresses. Separating these were coils of wash lines, both wire and hemp. The display is said to have attracted a great deal of attention. The idea of making special window displays covering certain lines of goods is one that has been found profitable, and it can be recommended to the notice of retail store keepers, as it calls for a very moderate amount of intelligence and taste to make an exhibit that will attract the attention of those who pass a store.

WILLIAM C. RAPELYEA, Danbury, Conn., bid \$2645 and secured the contract for plumbing the Danbury High School.

Putting Up Galvanized Iron Cornices.

BY WILLIAM NEUBECKER.

PART III.—ERECTING CORNICES IN SECTIONS, AND CORNICES OVER SHOW WINDOWS.

It is often the case that a cornice, say 10 feet high and 4 feet projection, cannot be hoisted and set on the wall in one piece. It must, therefore, be made in two sections, as shown by 1 and 2 in Fig. 8. The lower section A is placed upon the wall B in the usual manner, the iron brace having the anchor B extending into the wall at the bottom, and the anchor C at the top. Another anchor is placed in position, as at D. The wall can now be built up to the top of the lower section, as shown by C. It will be noticed that the metal from the dentil course F is carried up and turned over, as shown at G, which allows the locking of the upper section, as shown.

The wall being carried up flush with the top flange and anchor C, the upper section 2 is set over the lower section, having a drip, as at E, the flange of which goes

THE METAL WORKER

Putting Up Galvanized Iron Cornices.—Fig. 8.—Setting Cornices in Two Sections.

between the lock G, as shown. The iron brace H is placed in position, as before described in part II, before the cornice is set, having the anchor G attached to the main brace. When the cornice is properly set and fastened, the anchor J is put in position, after which the wall is carried up as high as K, ready for the iron or wooden lookouts to receive the roofing boards. In this manner a cornice of any height can be set, dividing it into as many sections as is desired.

In some of the larger cities the law compels the use of galvanized iron cornices over all show windows or store fronts. The method which is usually employed in fastening these store cornices is, however, so distinctly non-fireproof that the writer desires, in this connection, to call attention to it and suggest a remedy. In Fig. 9 is shown an illustration of the method now in vogue, in which A shows the top frame of the show window projecting from the line of the wall 12 inches, as required by law. After the show window is in place the ceiling boards B are placed in position, as shown. After this the cornice C, in which the brace D has been placed in the shop, is set on the ceiling boards. The drip E is high enough to hide the joint between the ceiling boards and frame A. As shown at F, a small angle is bent at the bottom of the brace to support the cornice. The drip is drawn tightly against the top frame A and nailed through the flange, as shown at F. Through the hole in the brace I a wire is fastened, as shown by H, and then fastened to the wall by means of the wall hook J. By using a rod to twist the wire, as

explained in the previous chapter, the cornice can be drawn in as desired.

So long as there is no danger of fire the cornice remains, but as soon as a fire occurs and the glass G is broken and the frame A and ceiling boards B begin to burn, thus weakening the frame A, the cornice comes down with a crash and defeats the object for which it was intended. If simple wrought band iron supports were constructed, as shown in Fig. 10, the danger of accident would be avoided, as no matter whether the

THE METAL WORKER

Fig. 9.—Non-Fireproof Method of Putting Up Store Cornices.

wooden frame was burned the cornice would remain the fire proof construction which it was intended to be.

The explanation of this construction, in detail, is as follows: A A represents the iron beams which span the opening of the store on which the brick wall rests, as shown by F. One-half-inch holes should be drilled into the flange of the beam at D about 3 feet apart. Then the iron supports, shown by C and made from $\frac{3}{8} \times \frac{1}{2}$

THE METAL WORKER

Fig. 10.—Wrought Iron Supports for Fire Proof Construction.

inch band iron, should be bolted to the flange 3 feet apart, as shown at D, the support passing through the wall a few courses above the beam, as at B, and being turned down at E. Knowing the thicknesses of the wall and the height of the beam and brick work, these supports can all be gotten out in the shop by the iron worker. Along the front, in a true line, an angle iron, H, should be run the entire length of the building or cornice, bolted, as shown at I, to the two bands of the support. Holes to admit $\frac{1}{2}$ -inch bolts should be punched at intervals of about 3 feet along L L of the angle, then when setting the cornice, partly shown by J, upon the angle iron L L bolts could be put through the flange of the drip, as shown at a. Of course band iron braces

must be inserted in the cornice, care being taken to make the drip M deep enough so as to pass the frame N under the same. When the drip is bolted the cornice should be drawn plumb by means of heavy wire passed from the brace in the cornice through the hole *b* in the support or band iron straps could be bolted to the cornice at *b*.

In this manner the cornice would be free from any wood work support. When planking the top of the cornice for the roofing, iron or wooden supports are sometimes used. Assuming that O P, in Fig. 9, is the pitch of the roof, care should be taken to have a cap flashing, L, built in as the work progresses below the sill, as shown. This is better shown in diagram X, in which N represents the brick course and M the cap flashing which is to be built in.

[THE END.]

Sheet Metal Panels in Marble Finishes.

Very artistic and attractive effects are produced by the imitation marble finishes applied to stamped sheet steel panels by the Brooklyn Metal Ceiling Company, 283-287 Greene avenue, Brooklyn, N. Y. We present herewith two examples of this work, which will give some idea of its appearance. In Fig. 1 is shown a section of wainscoting containing panels in black and white marble finish, with cap rail and base finished in imitation of Tennessee marble. An imitation onyx panel is given in Fig. 2. This panel is 22 inches square and presents a very fine effect. The work is finished in a durable manner. The coating is baked on the metal, and the manufacturers claim that it will not chip or flake off with ordinary wear. The fact that the sheets are stamped after they are coated is a convincing testimony

as their marble finishes and have the advantage over enameled porcelain tiles, as they are embossed and therefore present a richer appearance, while the cost is claimed to be only about one-quarter the price of the porcelain tile. These metal tiles are specially adapted for use on the walls and ceilings of bathrooms and stores.

as their marble finishes and have the advantage over enameled porcelain tiles, as they are embossed and therefore present a richer appearance, while the cost is claimed to be only about one-quarter the price of the porcelain tile. These metal tiles are specially adapted for use on the walls and ceilings of bathrooms and stores.

National Association of Master Composition Roofers.

The eleventh annual convention of the National Association of Master Composition Roofers, held at Providence, R. I., on July 16, was one of the best meetings of the body that has yet taken place. The sessions were presided over by the president, E. S. Bortel of Philadelphia, Pa., who, together with Secretary and Treasurer William K. Thomas of Chicago, presented the annual reports, which showed a flourishing condition of things in the trade. The principal subject of discussion was a recommendation contained in the secretary's report regarding the adoption of a label for materials of a uniform quality and a change in the constitution and by-laws of the association. It was voted that the association adopt a trade label which must be used upon materials of uniform grades. The details of this adoption of a trade label were left to the Executive Committee, with instructions to prepare such conditions as would meet with the approval of the national association.

The following officers were elected for the ensuing year: President, E. S. Bortel of Philadelphia; first vice-president, J. William Moore of Providence, R. I.; second vice-president, J. B. Oligschalger, Louisville, Ky.; secretary and treasurer, William K. Thomas of Chicago. Board of Directors: H. M. Reynolds, Grand Rapids, Mich.; W. B. Lupton, Pittsburgh, Pa.; C. B. Jameson, Buffalo, N. Y.

The next convention will be held in Louisville, Ky., some time in June of next year, the exact date to be selected by the secretary and treasurer and the second vice-president.

W. H. MULLINS of Salem, Ohio, who has made quite a reputation through his Sheet Metal Boats, is now manufacturing several classes of Row Boats in manganese bronze. It is stated that these Boats are being shipped to all parts of the world.
